Robinhood just made Stock Tokens collateral on Morpho. Posted there, they earn nothing.

Robinhood Crypto
@RobinhoodCrypto

Robinhood Stock Tokens can now serve as collateral on Morpho: a new use case beyond trading.

Robinhood Chain brings the rails, Morpho brings their credit layer, enabling holders to borrow against their Stock Tokens.

@RobinhoodCrypto on X, 2026-10-22, 55,663 views.

Every one of them sits idle while it backs a loan.

Morpho Blue on Robinhood Chain

$609.5M

53.6% of the chain's $1.14B. DefiLlama, 2026-10-23 16:55 UTC.

Earned by a Stock Token posted as collateral

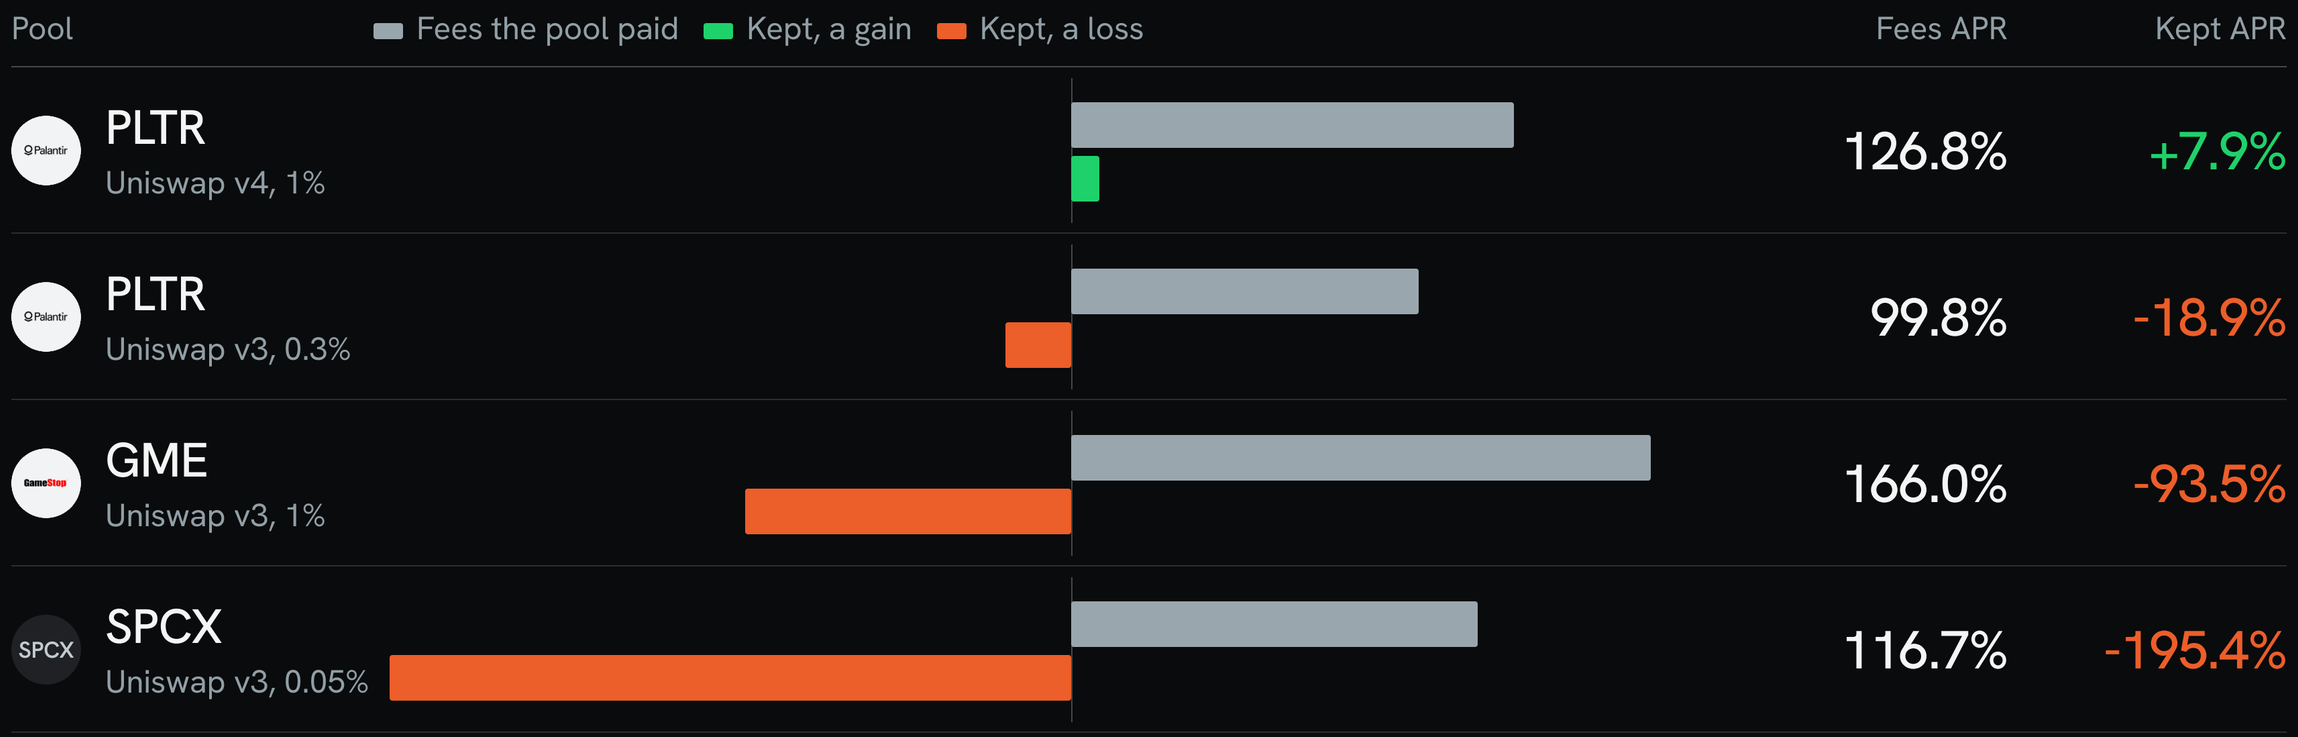

$0

Morpho Blue does not lend collateral out. The holder pays interest and the token sits.

The credit rail is open. The collateral on it sits idle.

Source: x.com/RobinhoodCrypto/status/2113270580472381515, captured 2026-10-24. cdata llama chain robinhood, 2026-10-23 16:55 UTC.

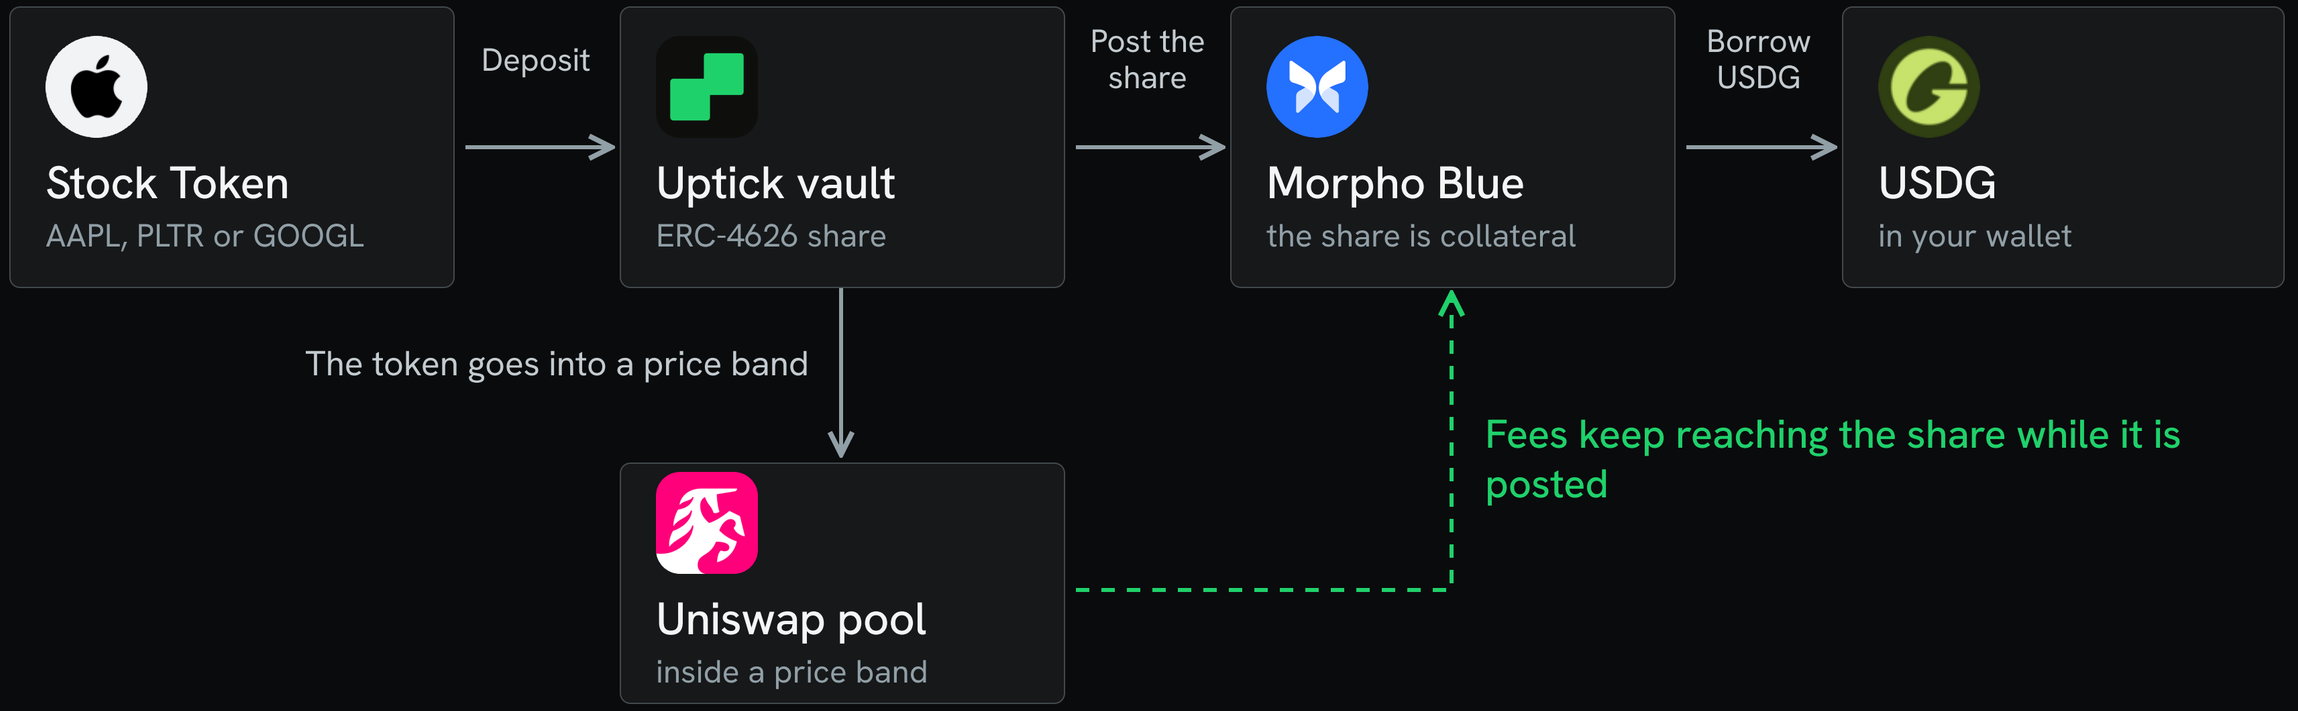

We replayed 3,059,881 swaps from the chain's pools. Fees are not yield.

The replay sets the door. Keeps money: open. Loses a little: capped. Loses most: closed.

Source: keeper/data/replay.json, held-out half, 15 days to 2026-10-17, annualised. Kept is fees less losses to informed traders and rebalancing cost. web/lib/vault-universe.json for the swap count.

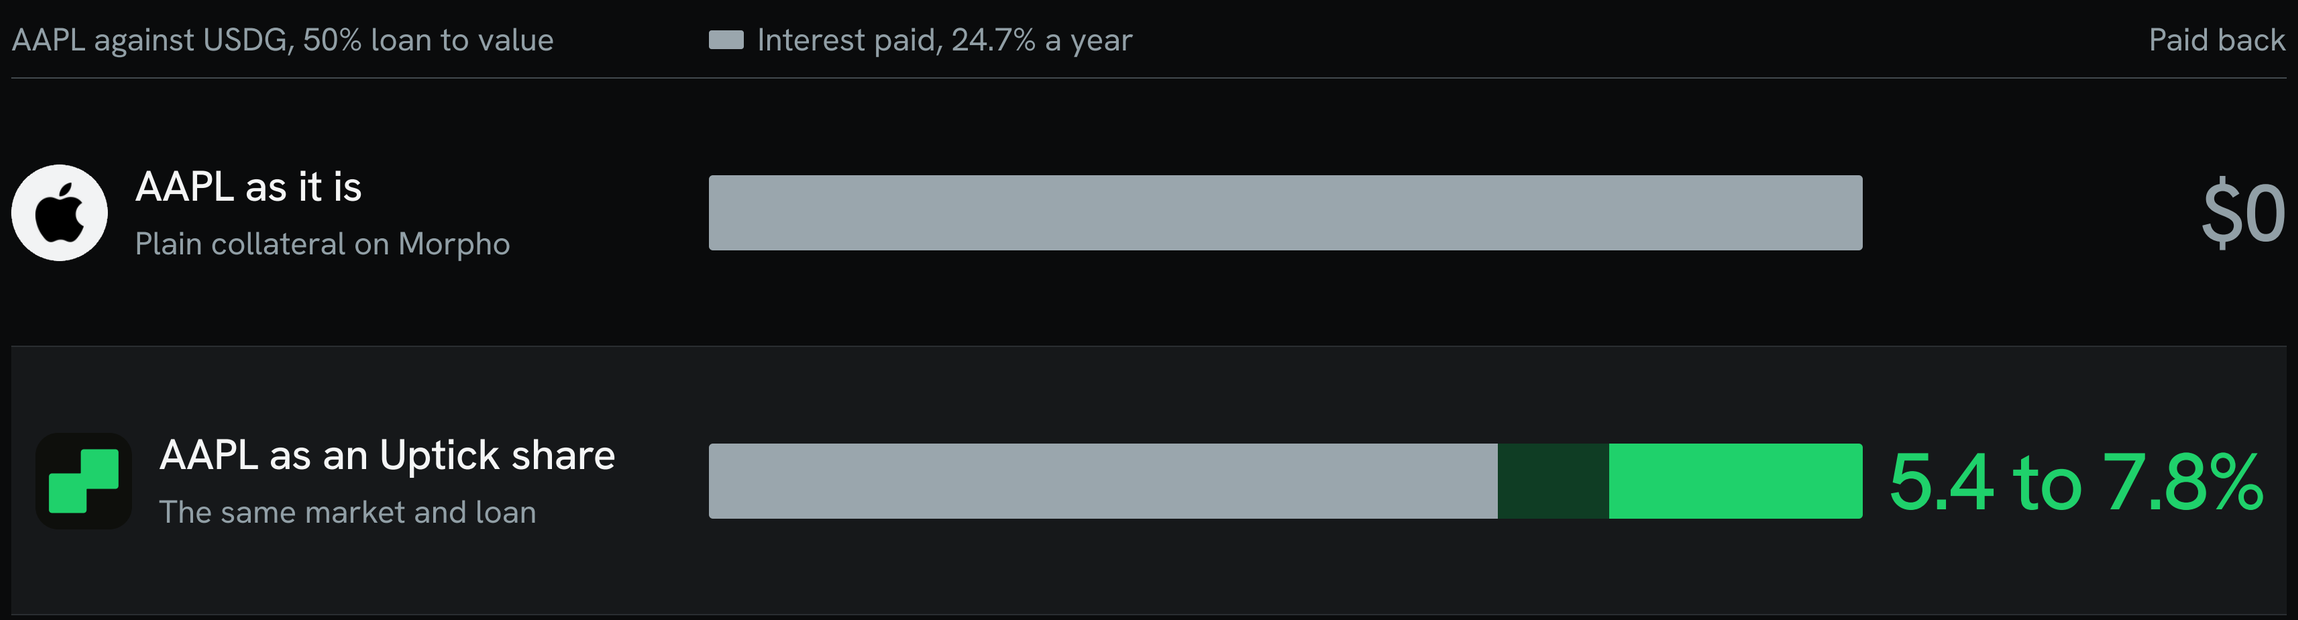

One deposit does two jobs: it earns in a Uniswap pool and backs a loan on Morpho.

Excited to see what gets built on top. Johann Kerbrat, Robinhood Chain, on the Morpho launch, X, 2026-10-22.

Source: x.com/JohannKerbrat/status/2113272709333536936, captured 2026-10-24. contracts/SECURITY.md, scripts/fork-demo.sh.

Posted as an Uptick share, collateral pays back a fifth to a third of the loan interest.

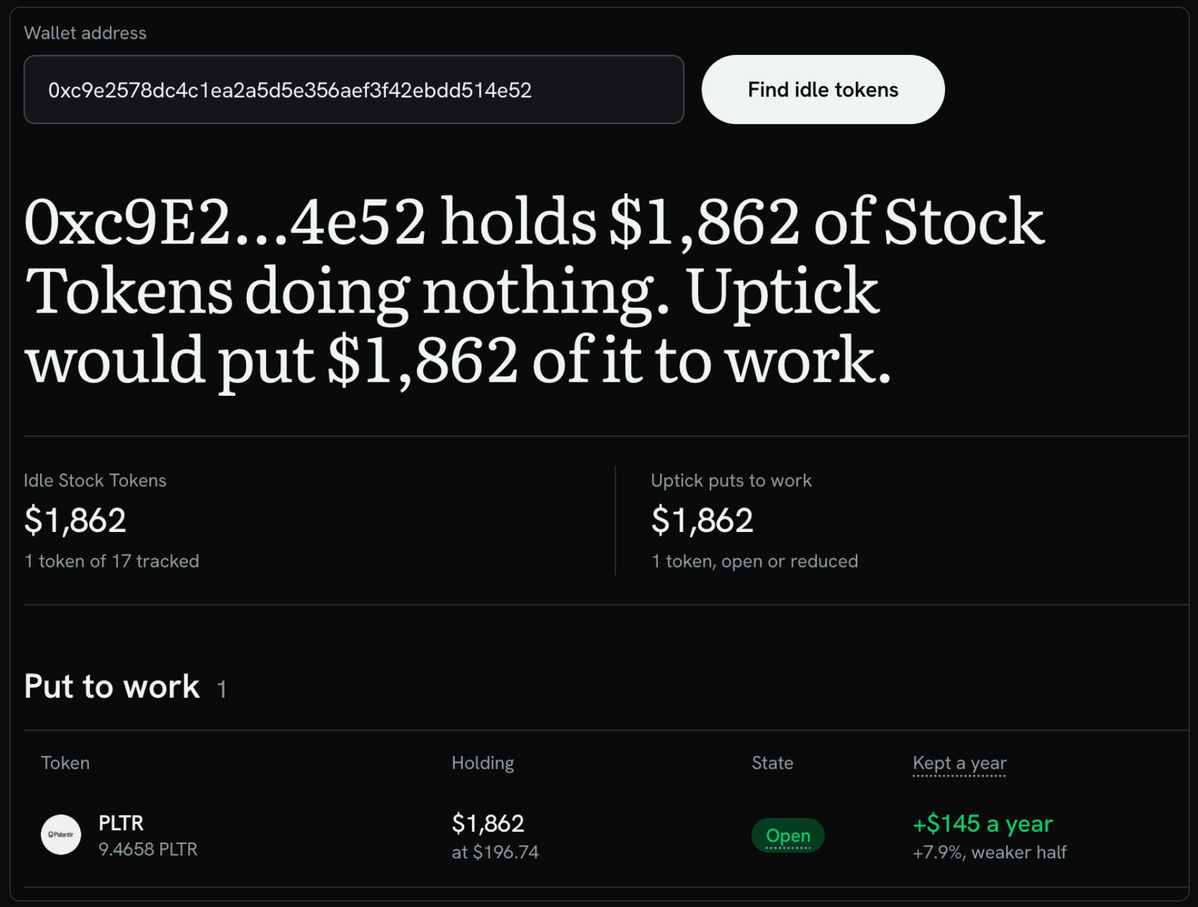

One read of the market, 2026-10-23 16:56 UTC. The rate moves and fee income varies.

The share earns while it is collateral, so the same loan costs less.

Source: blue-api.morpho.org, chain 4663, market 0xdeb4782d (62.5% LLTV), 2026-10-23 16:56 UTC. AAPL kept: web/lib/vault-universe.json.

From a pasted address to a loan on the same share.

/check on any address: read from the chain, nothing to connect or sign.

Then the loan, on the real Morpho Blue contract

8,691 USDG borrowed

against 42.6 AAPL posted as an Uptick share, limit 9,148 USDG.

- A market for the share
- A lender supplies USDG
- Deposit, post the share, borrow
- A 3% push on the pool leaves the price alone
- A stale feed closes deposits, exits stay open
- A feed drop liquidates, the shares exit in kind
- A feed older than 97 hours cannot liquidate

Every screen reads the chain, and one command runs the loan end to end.

Source: uptick-fi.pages.dev/check, address 0xc9E2…4e52, 2026-10-24. scripts/fork-demo.sh, 7 steps asserted, against Robinhood Chain state at block 96347563.

A 3% push on the pool moved the collateral price 0.2 bp. A pool-reading oracle moved 263 bp.

Collateral price moved by the same 3% push on the pool

Uptick share, priced from Chainlink alone

0.2 bp

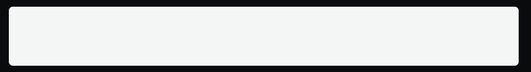

Control: an oracle that reads the pool

263 bp

412 contract tests, 141 of them security tests, and six written security reviews.

Share fall a borrower at the 62.5% limit survives

29.6%

Worst weekend gap in 123 days

7.75% USO

0.68% AAPL

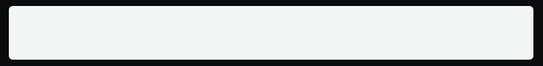

A liquidator exits in kind and comes out ahead

USDG repaid on the debt

5,767

USDG the seized shares exit for, 14.9% more

6,628

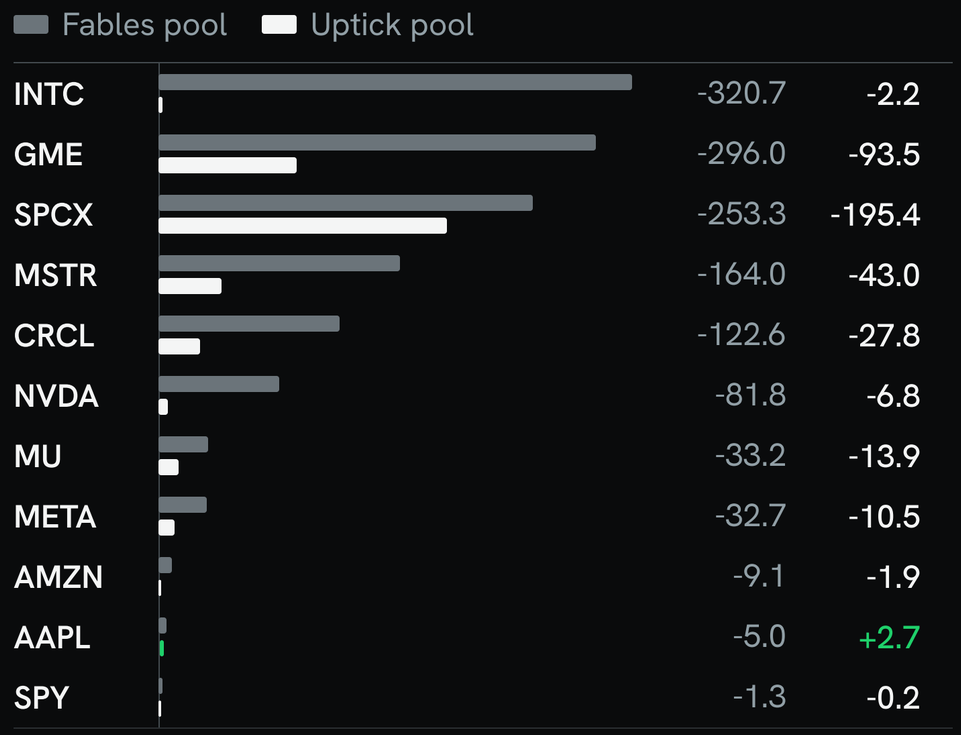

Nobody can push the price, and the buffer is several times the worst weekend gap on record.

Source: docs/FORK-DEMO.md steps 17 and 19 (scripts/fork-demo.sh). contracts/SECURITY.md, keeper/data/weekend-gaps.json (2026-06-22 to 2026-10-23). docs/facts.json.

An Uptick share does both: it earns the pool fees and it can be posted on Morpho.

Four ways to hold a Stock Token	Earns pool fees	Can be posted
Uptick share An ERC-20 priced from Chainlink	✓	✓
Plain collateral Posted on Morpho, it earns $0	—	✓
AutoRange One position per vault, no share	✓	—
Fables A v4 position is an NFT	✓	—

Weaker half kept, % a year, same token

On 11 of the 12 tokens a Fables pool can be replayed on, the pool Uptick picks keeps more.

Source: keeper/data/fables-replay.json, web/lib/vault-universe.json, weaker half; TSLA, below the floor in both, not drawn.

Stock Token pools paid liquidity providers $623.9k in a week. That is about $32M a year.

17 Stock Tokens
Uniswap v3 and v4 pools

→

$488.4M
traded in 7 days

→

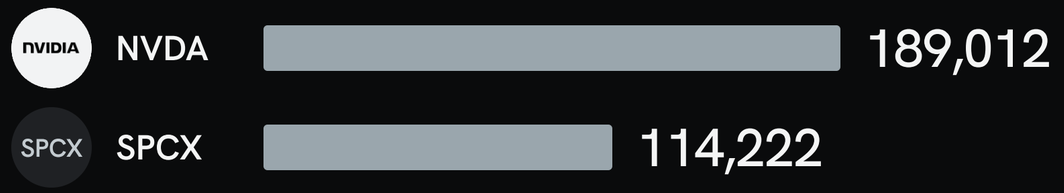

$623.9k
paid to LPs in 7 days

→

$32.4M
a year, one week times 52

Blocks 87,352,064 to 93,292,983, Uniswap v3 and v4 on the chain. The week is measured; the year is that week at the same rate.

Wallets holding a Stock Token on the chain

Blockscout, 2026-10-16. About half of the top ten tokens' supply sits in AMM pools.

How Uptick is paid

0% to 10%

of the fees a vault collects: 0% at launch, switched on per vault where the replayed kept stays positive after it.

The fee flow is measured, and the loan rail on top of it is new.

Source: docs/research/founder-house/vaults/VENUES.md (2026-10-13 to 2026-10-20), annualised by 52. PLATFORM-TRUTH.md (Blockscout, 2026-10-16).

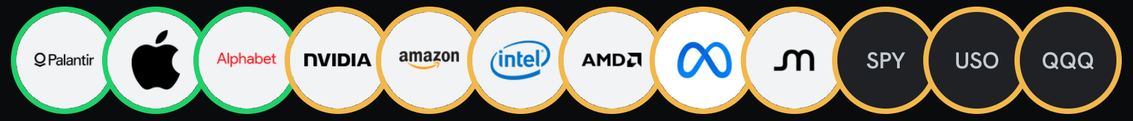

The app is live and reads Robinhood Chain: 17 Stock Tokens priced, nine tools for an agent.

Cleared to open 12

Open takes any amount. Reduced takes up to $25,000 a deposit.

Vault	Price	-20% floor	0	Kept	Fees	State
PLTR Palantir Technologies, 1%	$196.74			+7.9%	167%	Open
AAPL Apple, 0.05%	$346.80			+2.7%	19%	Open
GOOGL Alphabet Class A, 0.05%	$320.86			+0.2%	11%	Open

uptick-fi.pages.dev/vaults: price from Chainlink, kept APR against the floor, fees, door.

The 12 launching vaults: 3 open, 9 reduced.

One call from an agent, one answer from the chain

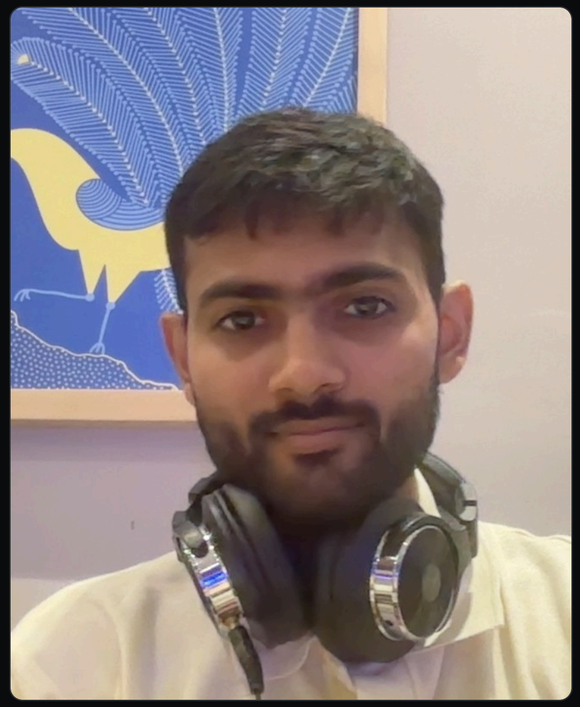

```
tools/call scan_wallet
address  0xc9E2...4e52
block    96366655
PLTR     $1,862.30  open
kept     +$144.88 a year
borrow   opens_with_market
```

Nine tools on one MCP endpoint: list, evidence, scan, deposit, withdraw, collateral terms, loan health, earn and borrow, make it safer.

A vault list, a wallet scan, a loan check and an agent endpoint, all reading Robinhood Chain.

Source: uptick-fi.pages.dev/vaults, captured 2026-10-24. scan_wallet answered by uptick-evidence.earn-shield-alerts.workers.dev/mcp, block 96366655, 2026-10-24. api/src/mcp.ts.

One founder built every layer, from the replay to the loan. This round adds two engineers.

Kamal

Founder, blockchain developer

Built every layer of Uptick: replay engine, vault contracts, web app, agent API

412 contract tests, 141 of them security tests, six written security reviews

712 public repositories on GitHub since 2021, github.com/kamalbuilds

Earlier product: Ava, a portfolio manager of AI agents for DeFi, getava.xyz

Hired with this round

Engineer, keeper
Recentres every vault after each session

Engineer, risk engine
The replay, the gate, the caps

One author shipped the whole path, from the measurement of the pool to the loan against the share.

Source: this repository (docs/facts.json). GitHub API, users/kamalbuilds, public_repos 712, read 2026-10-24.

We are raising $2M to put every Stock Token on Robinhood Chain to work.

Today, 12 launching vaults

$592,359

of deposit room in the launch caps

This round

$2M

Three uses, below.

In 12 months

$50M

of Stock Tokens earning, with a Morpho market on every open vault share.

A vault for every Stock Token

The day it lists, on v3 and v4 pools.

An external audit

Of the contracts that hold depositors' tokens.

Two engineers

On the keeper and the risk engine.

uptick-fi.pages.dev @uptickfi github.com/kamalbuilds

Appendix

The evidence behind each slide, and the two Open House canvases.

Demand and pool pages	What holders ask for, and the fee APR a pool page shows.
Doors and business model	Where a year of AAPL fees goes, the three doors, the launch caps.
The Morpho read	Borrow APY on four Stock Token markets, read 2026-10-23.
Price ranges and sessions	One price range for every token loses. In the 30-day replay, weekends pay $2.95 per $1 lost, NYSE hours $0.99.
Gate table	All 17 tokens, price range, weaker half and door.
Doing it yourself	Hold, one position set once, or an Uptick vault, on AAPL, GOOGL and PLTR.
Code, venues, security, agents	Four codebases compared, the venue census, six review reports, the MCP responses.
Open House canvases	Go-to-market and product, filled in for Uptick.

Source: this repository. Every figure carries its file on the slide it appears on.

189,012 wallets hold NVDA on Robinhood Chain. They are asking for yield on it.

"borrow/lend markets, where users can get yield by lending stock or pay yield by shorting stock"

@Nibel_eth, X, 2026-10-11

"tokenized equities like xStocks need to plug directly into defi lending markets so users can earn yield on SPYx or NVDAx while holding them"

@JackNomadsGOD, X, 2026-10-13

"I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks"

@WazzCrypto, X, 2026-10-15

Seven of the eight yield products measured take USDG or pairs. A holder sells the stock to join.

Source: gtm/uptick/DEMAND.md, verbatim. Holders: Blockscout, 2026-10-16. Products: vaults/COMPETITORS.md, read 2026-10-17.

A pool page shows fee APR. It does not show what an LP loses to fast traders.

AMD

131.6%

PLTR

160.4%

SPY

3.5%

Fee APR as one live vault page shows it, 46 times apart on one page, with no loss column.

On the chain's AAPL pool, 13.8 points of 18.7% a year in fees went to informed traders.

Source: TickerSpring Vaults page, copied as displayed, vaults/COMPETITORS.md, 2026-10-17. AAPL: web/lib/vault-universe.json, 30 days to 2026-10-17.

Deposit the Stock Token itself. See what you keep. Exit in kind any time.

No sale to join

The vault takes AAPL, NVDA or PLTR, not USDG and not a pair.

Fees beside what you keep

Every vault page shows both side by side, before you sign.

Both tokens come back

Exit in kind has no oracle, no swap and no pause in the way.

Where a year of AAPL fees goes: the pool pays 18.7%

13.8%
lost to informed traders, 1 hour markout

1.7%
spent recentring each day

3.3%
kept by depositors

Source: web/lib/vault-universe.json, AAPL, 30 days to 2026-10-17. contracts/SECURITY.md for exit in kind.

Every vault sits behind one of three doors.

Open
3 vaults take any amount
PLTR, AAPL and GOOGL kept money in both halves of the replay.

Reduced
9 vaults take up to $25,000 a deposit
The weaker half sits between -20% and break-even.

Closed
5 vaults take none
The weaker half kept less than the -20% floor.

Exit in kind is always open. Both tokens come back, with no oracle, no swap and no pause in the way.

Vault	Door	Weaker half
PLTR	Open	+7.9%
AAPL	Open	+2.7%
GOOGL	Open	+0.2%
SPY	Reduced	-0.2%
USO	Reduced	-0.9%
QQQ	Reduced	-1.3%
AMZN	Reduced	-1.9%
INTC	Reduced	-2.2%
AMD	Reduced	-4.7%
NVDA	Reduced	-6.8%
META	Reduced	-10.5%
MU	Reduced	-13.9%
TSLA	Closed	-25.8%
CRCL	Closed	-27.8%
MSTR	Closed	-43.0%
GME	Closed	-93.5%
SPCX	Closed	-195.4%

Source: web/lib/vault-universe.json, 30 days to 2026-10-17, weaker of two 15 day halves. contracts/SECURITY.md for exit in kind.

Depositors keep every fee at launch. A 10% share is sized by the vault caps.

Launching vault caps

$592,359

across the 12 launching vaults.

Uptick's share

0% to 10%

0% at launch. Switched on per vault, behind the 24 hour queue.

Entry fee, exit in kind

0.35% in, $0 out

The entry fee stays in the vault for the holders who stay.

Stock Tokens in the 12 vaults	Fees collected a year	Uptick at 0%	Uptick at 10%
$148,090	$63,531	$0	**$6,353**
$296,180	$127,061	$0	**$12,706**
$592,359	$254,123	$0	**$25,412**

A vault holds at most 20% of its pool's in-range liquidity, so revenue grows with pool depth and with each token that launches.

Source: web/lib/vault-universe.json (depositCapUsd and 30 day fee APR per vault, 42.9% weighted by cap, before losses to informed traders). Rows at 25%, 50% and 100% of the caps. contracts/script/DeployAll.s.sol (PERF_FEE_BPS, default 0), contracts/SECURITY.md.

Morpho already lends USDG against Stock Tokens at 20% to 25% a year.

Collateral	Loan limit	USDG supplied	Utilization	Borrow APY
AAPL	62.5%	$221,409	90.5%	**24.7%**
NVDA	62.5%	$729,089	85.2%	**23.5%**
SPCX	62.5%	$580,958	90.1%	**22.1%**
GOOGL	62.5%	$292,732	90.0%	**20.4%**

Every one of these loans is backed by collateral that earns nothing while the interest runs. An Uptick share posted in its own Morpho market earns its kept APR on top.

Source: blue-api.morpho.org, chain 4663, 512 markets, 2026-10-23 16:56 UTC. The largest USDG market at 62.5% for each collateral; rates are variable.

One price range for every token would lose: the range that kept +29.0% on NVDA kept -57.3% on GOOGL.

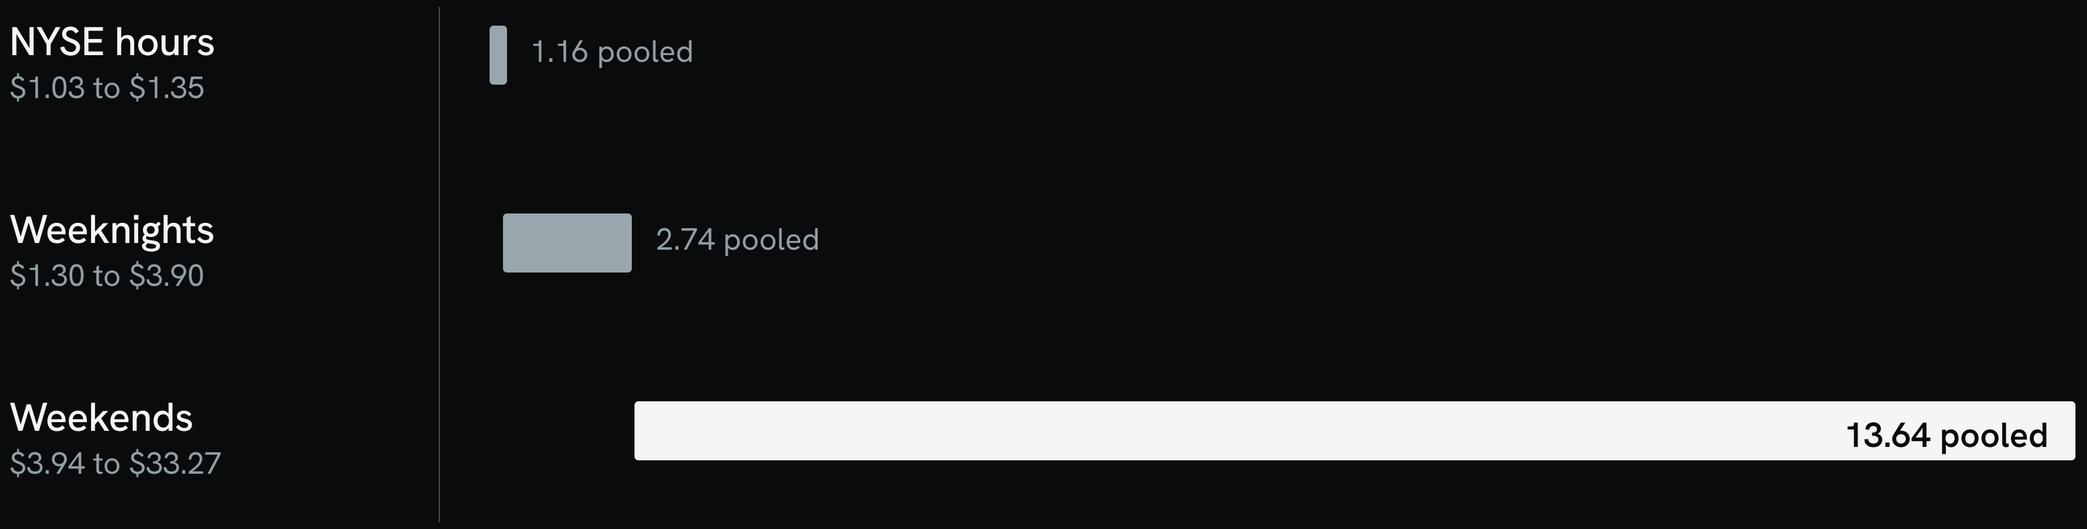

Kept APR in the calibration half, by price range. Each token picks its own, and the held-out half decides the door.

	Range ±1.5%	Range ±5%	Range ±20%
NVDA	+29.0%	+12.1%	+3.3%
AAPL	-10.1%	+2.5%	+1.6%
GOOGL	-57.3%	-5.5%	+0.2%

The picks: NVDA ±1.5%, AAPL ±7.5%, GOOGL ±20%. The ranges run from ±1.5% to ±20% across the 17 tokens.

Source: keeper/data/band-grid/grid-summary.json (calibration half, 2026-09-17 to 2026-10-02), keeper/data/params.json.

In a fixed range on NVDA, SPCX and TSLA from 24 August to 17 October, a weekend pays $13.64 per $1 lost to fast traders. NYSE hours pay $1.16.

5,113,049 swaps, three pools

NVDA, SPCX and TSLA on Robinhood Chain. The weekend ratio beats the NYSE ratio in 22 of 23 pool-weeks.

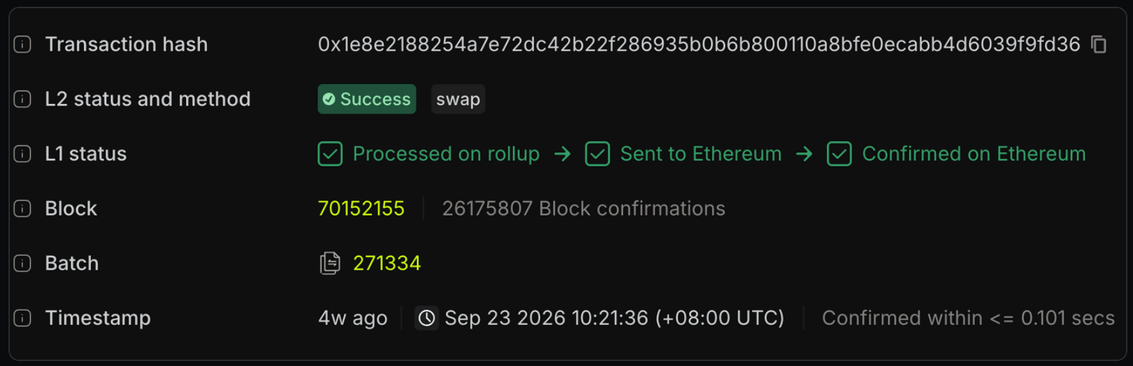

The engine drops what its own replay refutes

A schedule built on the clock met its bar on 0 of 3 tokens, and random session labels beat it in 64 of 64 cells. Twelve off-chain signals failed their shuffled control. Uptick acts on pool and price range, measured per token.

Source: README.md, spikes/stock-vaults/FINDINGS.md, spikes/offchain-signals/FINDINGS.md. Fee earned per $1 lost to informed flow, 1 hour markout, window 2026-08-24 to 2026-10-17.

With Nasdaq shut, one PLTR sale paid its pool $178.30 and cost its liquidity providers $241.83.

Sold, 10:21 PM New York	95.8 PLTR
Pool price, Chainlink price	$186.51, $184.67
Pool price an hour later	$183.75
Fee the pool earned	$178.30
Lost to liquidity providers	$241.83
Fee per $1 lost	$0.74

The transaction on Blockscout. The page clock reads +08:00; 10:21:36 there is 02:21:36 UTC. One routed trade made 7 pool swaps; this is its PLTR / USDG leg.

The replay counts every swap this way. Across the 17 pools the vaults sit in, a weekend earns $2.95 in fees for every $1 lost, NYSE hours $0.99.

Source: keeper/scripts/moment.py, keeper/data/replay.json window 2026-09-17 to 2026-10-17. Tx 0x1e8e2188254a7e72dc42b22f286935b0b6b800110a8bfe0ecabb4d6039f9fd36 read with cast tx on rpc.mainnet.chain.robinhood.com. Loss is the 1 hour markout.

Each token picks its price range on the first half. The second half decides the door.

AAPL kept +2.7% a year in its weaker half

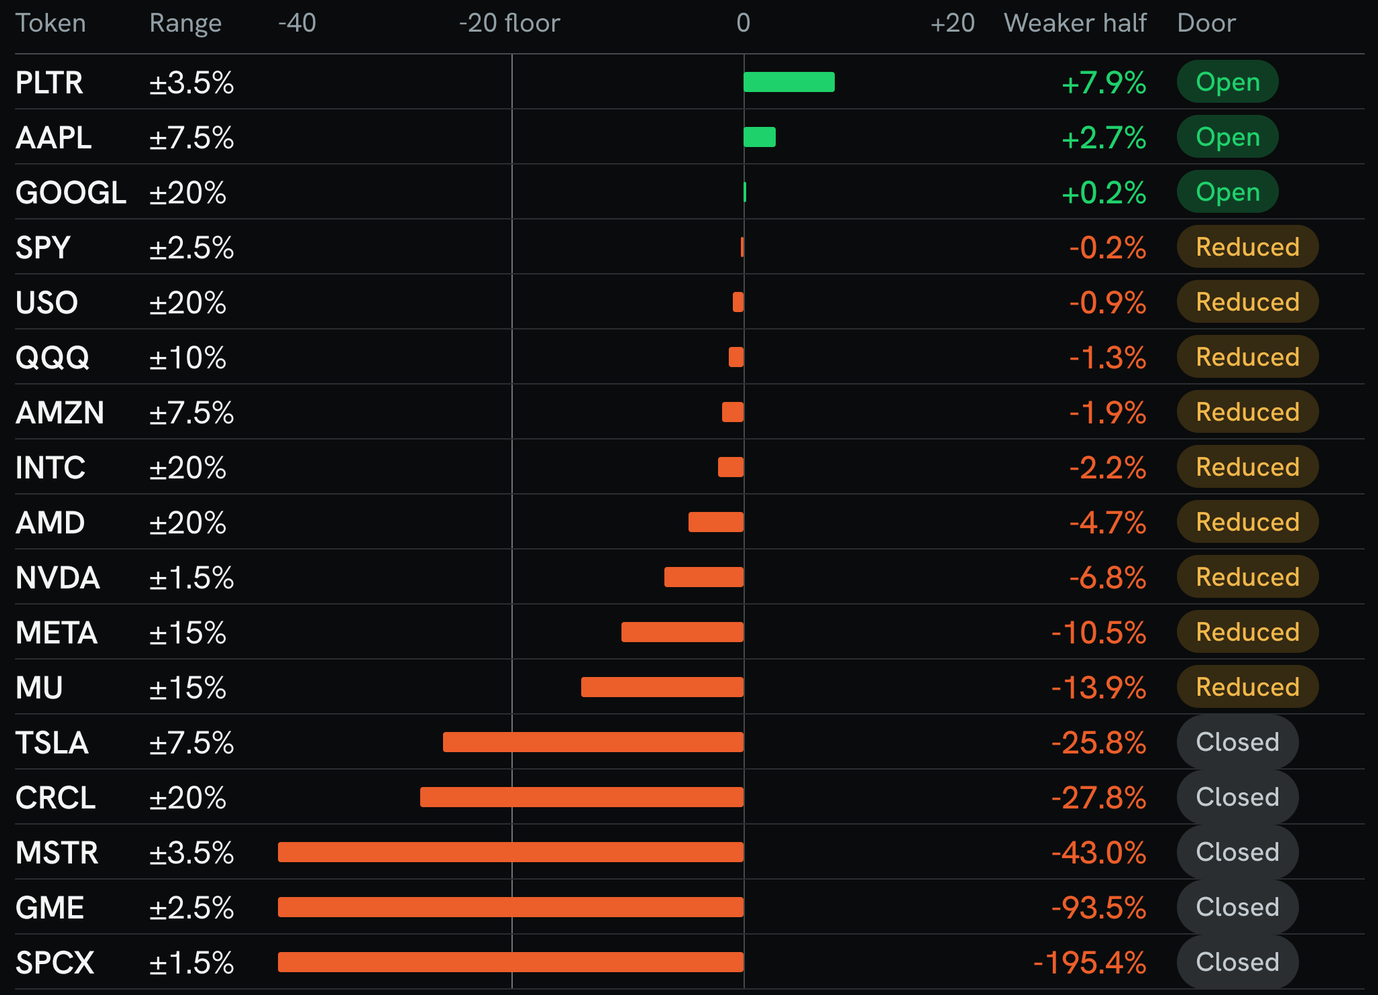

Range ±7.5%. First half +2.7%, held-out half +3.9%. Open. GOOGL keeps +0.2% and PLTR +7.9%, open too.

NVDA's tight price range kept +29.0% on the first half

The held-out half kept -6.8%. The gate shows the held-out number, so NVDA is reduced.

The conservative figure decides

The upper accounting bound sits beside it on every vault page.

Source: web/lib/vault-universe.json, keeper/data/params.json. Weaker half of two 15 day halves, 30 days to 2026-10-17. Bars end at -40.

A Uniswap position is an NFT that Morpho Blue cannot take. An Uptick share is an ERC-20 it can.

Token	Half read	Hold	Set once	Uptick vault	Set once kept a year	Vault kept a year
AAPL	first 15 days	-0.8%	+0.4%	**-0.1%**	+4.3%	**+2.7%**
GOOGL	first 15 days	-1.7%	-0.3%	**-0.8%**	+0.8%	**+0.2%**
PLTR	last 15 days	-1.9%	+0.0%	**-3.1%**	+0.0%	**+7.9%**

Hold, set once and vault are the 15-day return on the deposit in the half the gate reads. Kept is the gate's annualised unit, with the price drift left out.

Hold it, set one position, or deposit: the same 15 days. The share also recentres itself, and exit in kind pays out both tokens.

Source: keeper/data/diy-baseline.json, docs/DIY-BASELINE.md (all 17 tokens). Same swaps, markout and cost model as the gate; range bounds snapped to the pool's tick spacing.

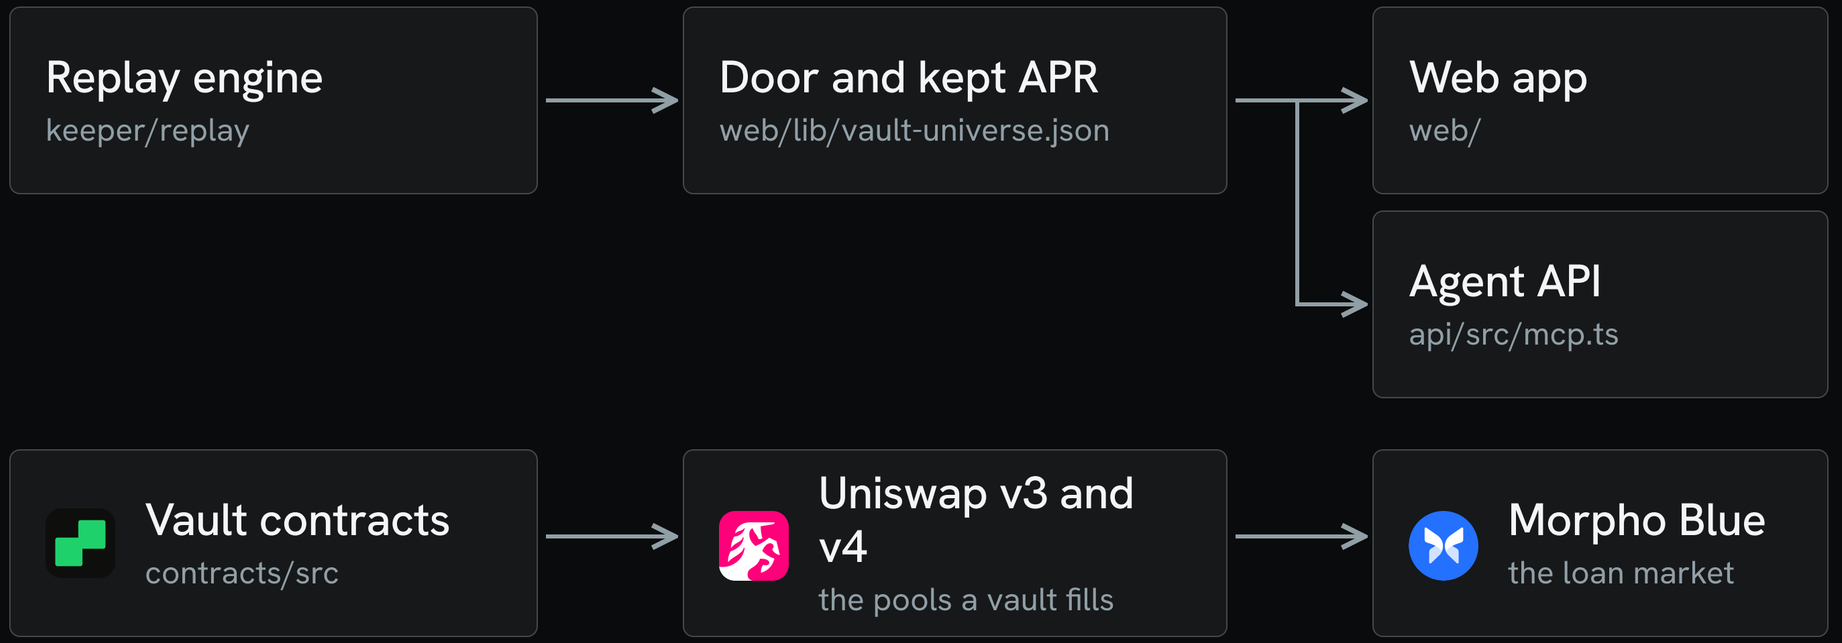

None of four vault codebases has a settings timelock or stock-split handling. Uptick has both.

Codebase	Owner settings	Stock split	Deposit priced from
AutoRange	24 setters, each takes effect at once	Raw balances and ticks, no multiplier	Pool spot
Arrakis V2	Manager, fee, pool and router change at once	Plain ERC-20 shares, no multiplier	Pool spot
Gamma	setFee, setTwapCheck, ownership: one transaction	Raw balances, no multiplier	Pool spot, optional 1 hour TWAP filter
Veda	Bounds, fees and roots apply in the same transaction	No ERC-8056 or rebase logic	Stored rate, no maximum age
Uptick	**24 hour queue**, calldata emitted, void after 7 days	**ERC-8056 gate**: price-checked paths close around each multiplier change	Lowest of Chainlink, TWAP and spot

Session-fee hooks (Fables, SessionFeeHook, Bellswap, ClosingBell) price swaps. Range vaults pick price ranges by hand. Uptick publishes the calibration for every token and opens a door only where it holds.

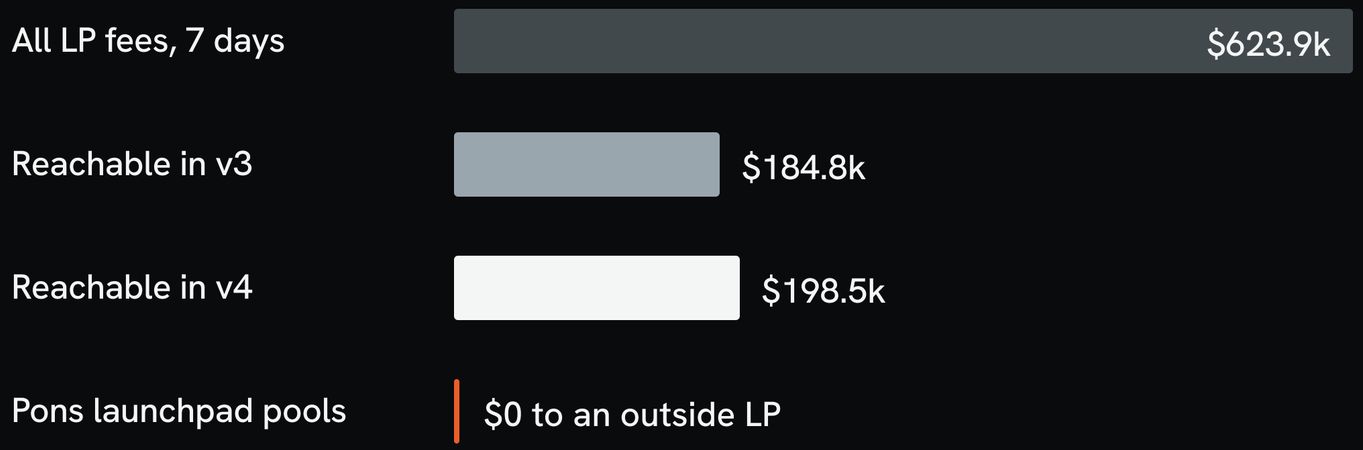

Source: competitors/*/STUDY.md with file and line citations (Arrakis V2, Gamma Hypervisor, Veda BoringVault, AutoRange). Uptick: contracts/SECURITY.md.

One repository holds the replay, the vaults, the app and the agent API.

Source: this repository. keeper/replay, contracts/src, web/, api/src/mcp.ts, scripts/fork-demo.sh.

The fees sit in more than one pool. The v4 adapter widens the pot a vault can reach.

$488.40M of Stock Token volume moved through Uniswap v3 and v4 on the 17 tokens in 7 days. Launchpad pools pair a stock with a memecoin across 256 traded pools and $9.95M, and take their fee in the hook.

PLTR, price range 350 bps

The v3 0.3% pool keeps -18.9% in its weaker half. The v4 1% pool keeps more, so PLTR deploys on v4 and opens.

+7.9%

What the PLTR v4 1% pool keeps in its weaker half in the same replay, net of the PoolManager's protocol fee. A token deploys on the venue whose pool keeps more in its weaker half: PLTR, SPY and USO sit on v4.

Built: the v4 position adapter

StockVaultV4 holds a position in a hookless v4 pool, with the same guards and the same evidence gate.

Source: docs/research/founder-house/vaults/VENUES.md (2026-10-13 to 2026-10-20, read over the public RPC). keeper/data/replay.json, PLTR pools.

Six review reports. Each vault round re-read the last round's fixes and round four ended SHIP.

Round 1	1 High and 3 Medium, all closed	A same-block share lock and a spot-to-TWAP price range against deploy sandwiches. Deposits priced at the lowest of Chainlink, TWAP and spot. A 24 hour owner queue. A corporate-action gate on the token's oracle pause and multiplier.
Round 2	Round 1 fixes confirmed	Swap floors include the pool fee, so 1% pools rebalance. Router deposits clear at $500, $2,000 and $10,000.
Round 3	TWAP bound set to 30 bp	Entry fee raised to 35 bp, so a deposit ahead of a price update does not pay. Exits work on every fee tier.
Round 4	SHIP: no Critical, High or Medium	Residuals are published with their measured bounds and the lever that moves each.

141
security tests run on a fork of the real pools

50
mutation checks: break a guard, see red, restore, see green

24 h
queue on every owner setting, with the full calldata emitted

In kind
exit stays open when everything else is closed

Source: contracts/SECURITY.md and the six reports in contracts/ (SECURITY-REVIEW, SECURITY-REREVIEW, SECURITY-REVIEW-3, SECURITY-REVIEW-4, SECURITY-REVIEW-V4, SECURITY-REVIEW-ORACLE). Contracts final, creation-code hash pinned.

Agents read the same evidence the app shows.

list_vaults	Every vault with its door, fee APR and kept APR.
get_vault_evidence	Replay pools, gate rule, reason and swap count.
prepare_deposit	Unsigned transactions. The user signs and sends.
prepare_withdraw	Unsigned exit transactions, in kind included.

One endpoint, MCP over Streamable HTTP. A closed vault returns its gate reason, so an agent never routes a deposit past the door.

GET /vaults/aapl, gate.reason

"Open: the weaker half of the 30-day replay kept 2.7% a year, at or above break-even, across 95,275 swaps."

tools/call prepare_deposit, id spcx, amount 10

{"error": "Closed: the weaker half kept -195.4% a year, below the -20% floor."}

GET /vaults/aapl, pools: fee APR, first half, held-out half

Pool	Fees	First	Held-out
v3 0.05%	18.7%	+2.7%	+3.9%
v4 0.3%	22.2%	+7.7%	+0.5%
v3 0.3%	11.1%	-13.3%	-11.7%

Evidence API and MCP: uptick-evidence.earn-shield-alerts.workers.dev; figures as keeper/src/evidence.ts builds them from keeper/data/replay.json (2026-10-23). llms.txt and the evidence API are open to any agent.

Go-to-market canvas

Arbitrum Open House Singapore

Team name

Uptick
Kamal, founder

One line

Deposit a Stock Token, earn the fees that survive, borrow USDG against the share.

Who buys, who uses

Buys and uses: Stock Token holders on Robinhood Chain, 189,012 of them on NVDA. Also uses: agents on the MCP endpoint. Carry the kept APR and list the share: curators, lenders and wallets.

First reachable audience

26 holders and LPs who posted about stock-token yield in the last 30 days, led by @WazzCrypto (62,039 followers) and @Nibel_eth (36,595).

3 distribution channels

1. Named DMs and replies on X
2. 15 minute calls with 18 projects
3. /talk interviews and the open evidence API

Core message

Robinhood made Stock Tokens collateral on 22 October. Fees are not yield: Uptick shows what you keep, and the share can be borrowed against.

Proof you need first

The first mainnet deposit into an open vault, one signed holder LOI and a Morpho market on an Uptick share.

The intro that helps

Arbitrum Foundation to **Gaëtan Thabot**, Robinhood Chain partnerships, to put the vault list in front of Stock Token holders.

5 named targets

1. @WazzCrypto, LPs stock tokens by hand
2. Steakhouse Financial (SebVentures): curate the first share market, $538.0M on the chain
3. Zona (DataLust): vault shares as collateral
4. AutoRange (elkiyo.eth): list Uptick vaults
5. Rabby (Galen Yuan): show vault positions

The ask this weekend

The Thabot intro, calls with Steakhouse and Zona, three holders sizing a first deposit. **uptick-fi.pages.dev/talk**

Source: gtm/uptick/TARGETS.md, PIPELINE.md, EVIDENCE.md. web/lib/vault-universe.json. docs/research/founder-house/PLATFORM-TRUTH.md.

Deposit a Stock Token, earn the fees that survive, borrow USDG against the share.

Who is this for

@WazzCrypto, 62,039 followers, LPs tokenized stocks on Robinhood Chain by hand: "I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks."

What they do today

Hold NVDA idle, or LP by hand: pick the pool, the fee tier and the price range, then read a fee APR with no loss column.

The wedge

Kept APR, measured per token on 3,059,881 replayed swaps, on a share Morpho can take as collateral. 3 open, 9 reduced, 5 closed.

Why now

22 October: Robinhood made Stock Tokens Morpho collateral, "any app can tap into these markets". Morpho Blue holds $609.5M of the chain's $1.14B.

Alternatives and gaps

HedgeHood: weekly covered calls on NVDA. TickerSpring, AutoRange: USDG in. Morpho: lenders earn, collateral does not. None shows kept APR.

Why onchain, why Arbitrum

Robinhood Chain is an Arbitrum Orbit chain. The Stock Token, its Chainlink feed and the USDG pool share one chain, so valuation and exit need no bridge. Agents read it over MCP.

First 5 to 10 users, named, reachable this month

@WazzCrypto, @Nibel_eth, @0xFent_, @JollyDinger, @cryptonoah11, @omarsaleh66, @0x_iroh, @0xlippit. Each one posted about stock-token LPs or yield in the last 30 days and has a message queued.

Ship this weekend

The first mainnet vaults. The 90 second demo: /check, Earn and borrow, fork-demo.sh. /talk interviews in the room.
