Put your stock tokens to work.

Deposit AAPL, GOOGL, NVDA and 9 more Stock Tokens and earn a share of every trade's fee. Uptick shows what you keep after losses to fast traders, and opens a vault only where past swaps say it holds up.

Vaults at launch	Swaps replayed	Fees paid to liquidity providers	Stock Tokens tracked
12	3.1M	$1.1M	17
AAPL, GOOGL, NVDA and 9 more	30 days to 2026-10-17	On the 17 vault pools, 30 days	Chainlink priced, USDG pools

Source: web/lib/vault-universe.json and web/lib/pool-fees.json, the summary row of the vault list.

Holders ask for yield on the stock they already hold.

189,012

wallets hold NVDA on Robinhood Chain. The tokens sit in wallets and earn nothing.

114,550

wallets hold SPCX on the same chain.

"borrow/lend markets, where users can get yield by lending stock or pay yield by shorting stock"

@Nibel_eth, X, 2026-10-11

"tokenized equities like xStocks need to plug directly into defi lending markets so users can earn yield on SPYx or NVDAx while holding them"

@JackNomadsGOD, X, 2026-10-13

"I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks"

@WazzCrypto, X, 2026-10-15

"Clients holding SPYx, QQQx or NVDAx can deposit them and earn yield in the same asset while keeping market exposure."

u/SolBrothers_, r/solana, 2026-09-14, on a live product on another chain

Source: gtm/uptick/DEMAND.md, verbatim. Holder count: Blockscout, 2026-10-16.

Every vault sits behind one of three doors.

Open

3 vaults take any amount

AAPL, GOOGL and PLTR (on its Uniswap v4 pool) kept money in both halves of the replay.

Reduced

9 vaults take up to $25,000 a deposit

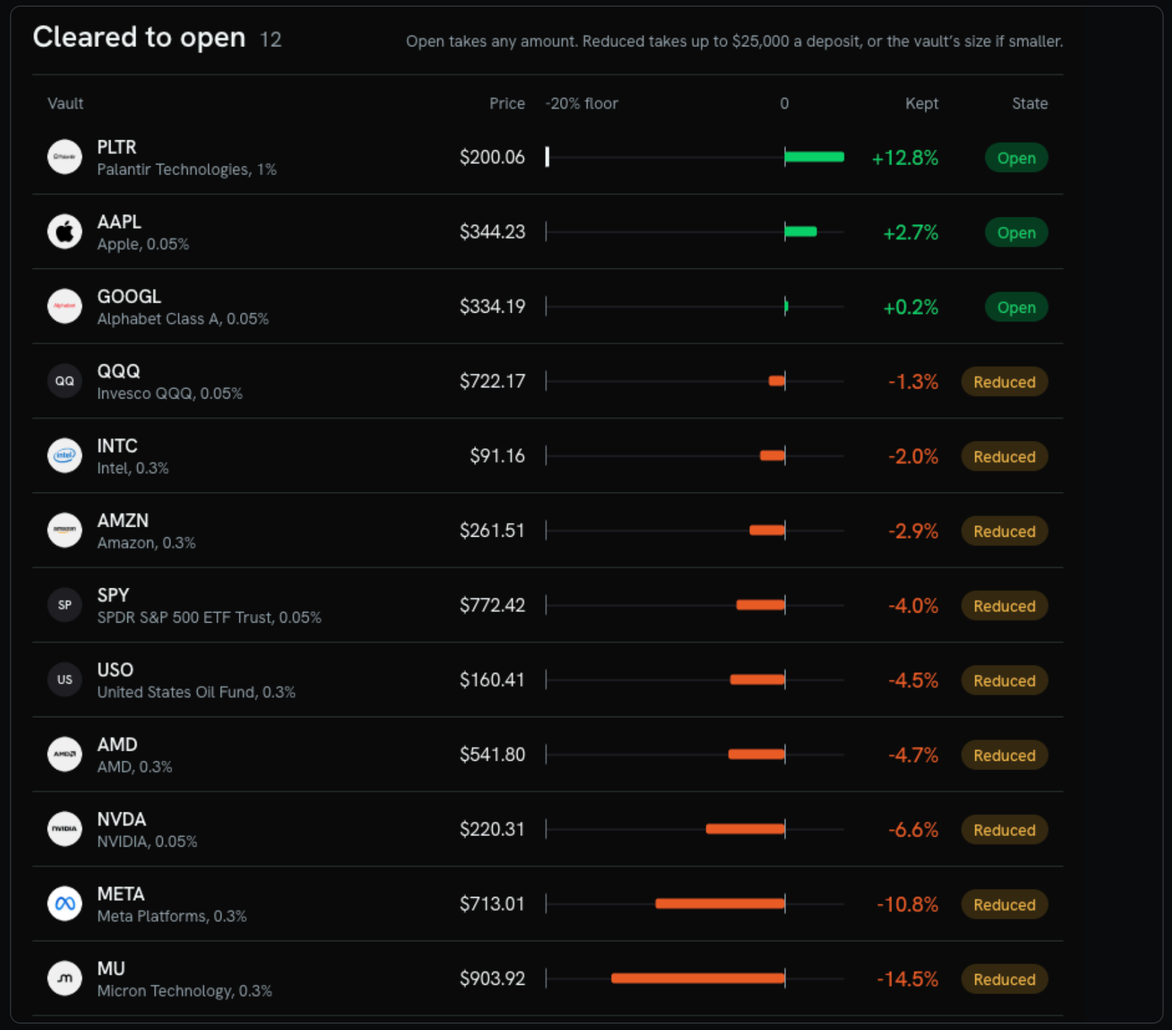

The weaker half sits between -20% and break-even.

Closed

5 vaults take none

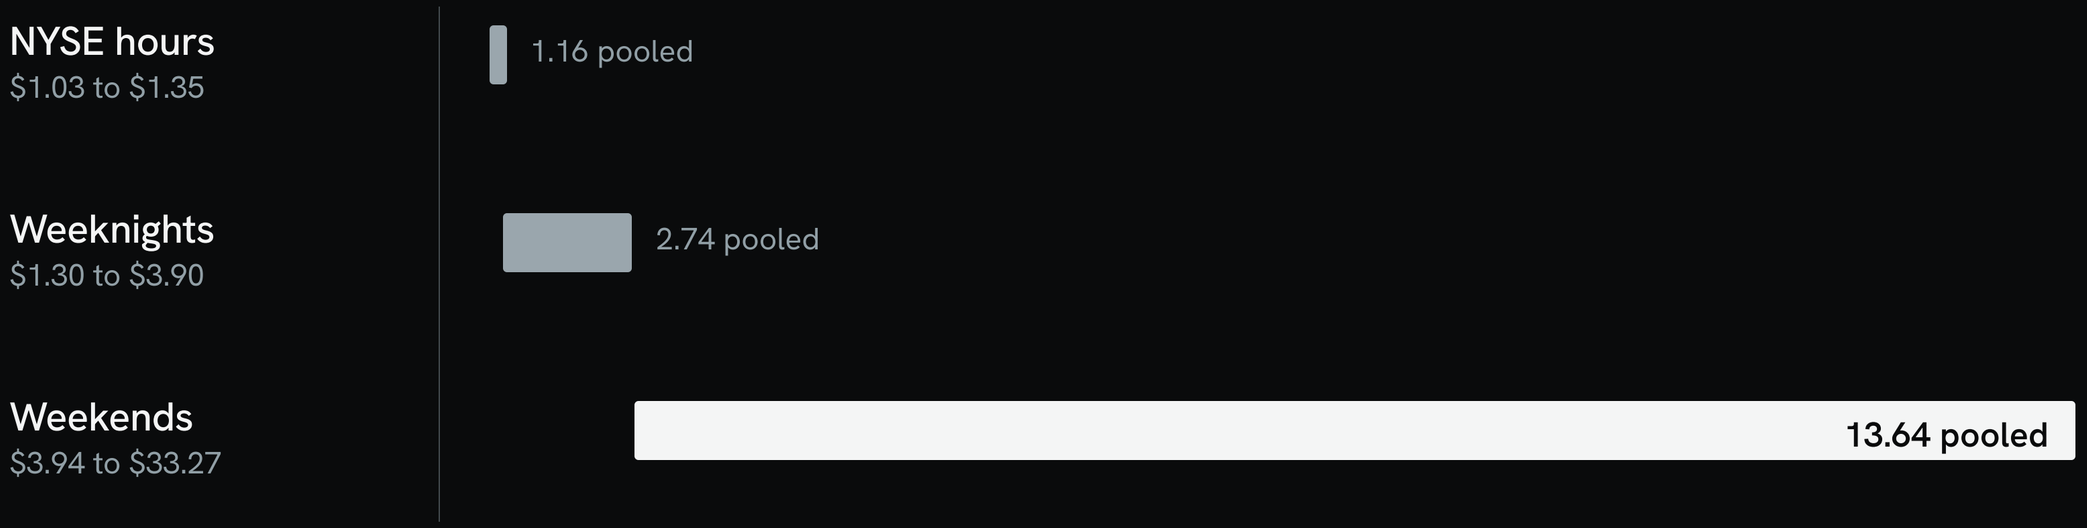

The weaker half kept less than the -20% floor.

Exit in kind is always open. Both tokens come back, with no oracle, no swap and no pause in the way.

Source: web app vault list from web/lib/vault-universe.json, captured 2026-10-22. contracts/SECURITY.md for exit in kind.

A weekend pays $13.64 in fees for every $1 lost to fast traders. NYSE hours pay $1.16.

5.1M swaps, 54 days, three pools

NVDA, SPCX and TSLA on Robinhood Chain. The weekend ratio beats the NYSE ratio in 22 of 23 pool-weeks.

The engine drops what its own replay refutes

A schedule built on the clock met its bar on 0 of 3 tokens, and random session labels beat it in 64 of 64 cells. Twelve off-chain signals failed their shuffled control. Uptick acts on pool and band, measured per token.

Source: README.md, spikes/stock-vaults/FINDINGS.md, spikes/offchain-signals/FINDINGS.md. Fee earned per $1 lost to informed flow, 1 hour markout, window 2026-08-24 to 2026-10-17.

Each token picks its band on the first half. The second half decides the door.

AAPL kept +2.7% a year in its weaker half

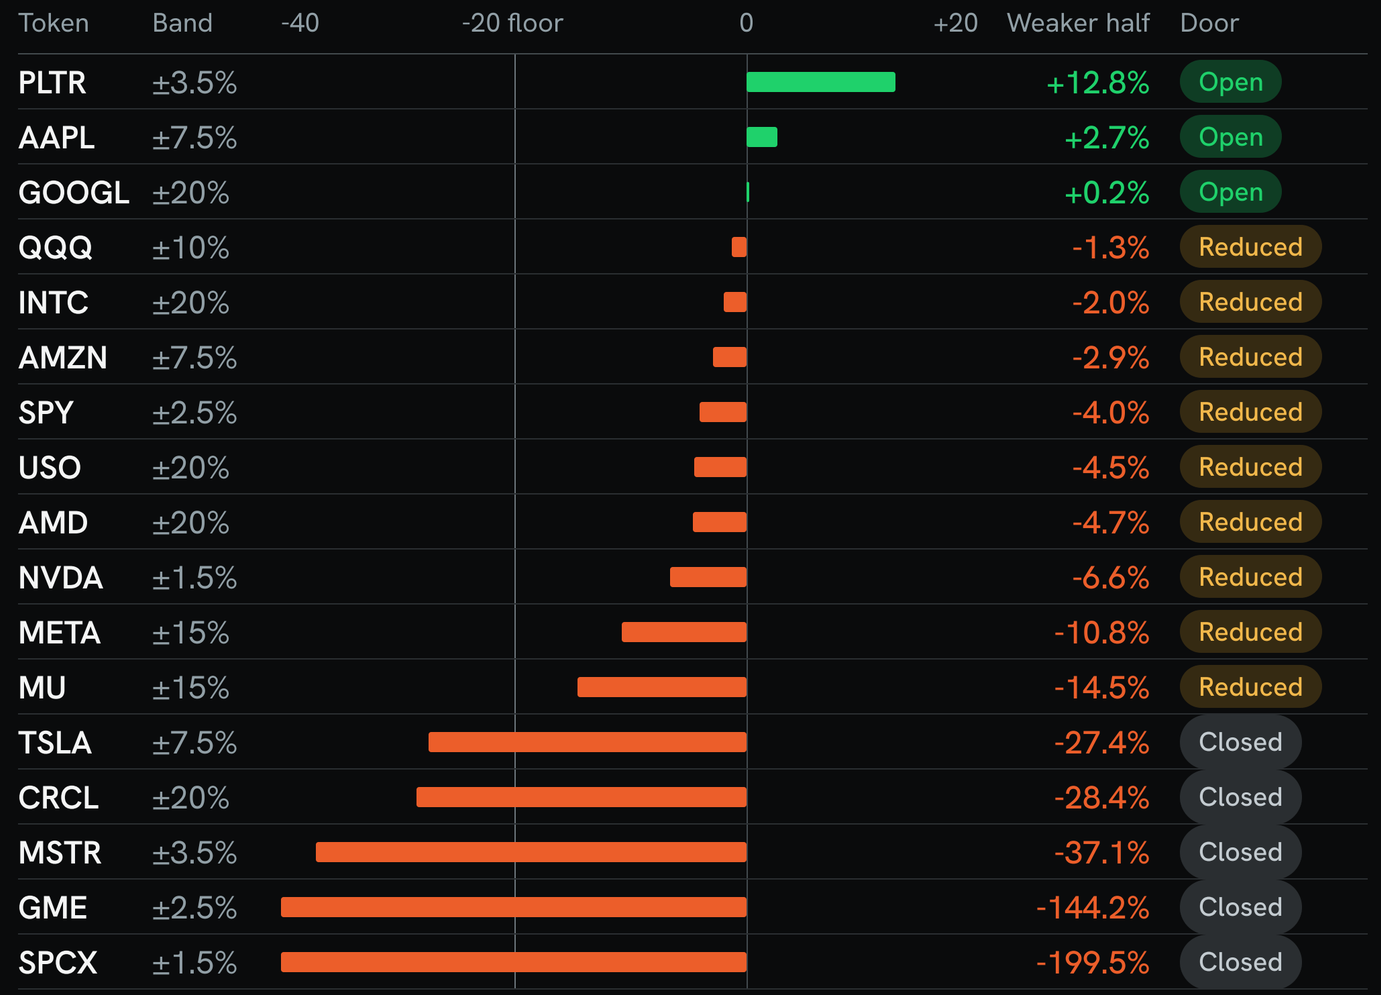

Band ±7.5%. First half +2.7%, held-out half +3.9%. Open. PLTR keeps +12.8% on its v4 pool.

NVDA's tight band kept +29.4% on the first half

The held-out half kept -6.6%. The gate shows the held-out number, so NVDA is reduced.

The conservative figure decides

The upper accounting bound sits beside it on every vault page.

Source: web/lib/vault-universe.json, keeper/data/params.json. Weaker half of two 15 day halves, 30 days to 2026-10-17. Bars end at -40.

AAPL's pool paid 18.8% a year. Depositors kept 3.2%.

Where a year of fees goes

30 days to 2026-10-17

Fees the pool paid, a year +18.8%

- **Kept over the full 30 days** +3.2%
  What stays with depositors after both losses, over the whole window.
- **Recentring cost** 1.7%
  The reposition at 02:00 UTC after each NYSE session.
- **Lost to informed traders** 13.9%
  Trades from people who knew the price was about to move.

$17.08
of every $100 the pool pays stays with depositors. $9.01 pays for recentring and $73.91 goes to informed traders.

0.35%
entry fee, kept in the vault for the holders who stay. It covers 97.2% of the feed's round-to-round moves.

10%
of collected fees is Uptick's share, minted so the share price never steps at harvest.

No fee
on exit in kind, in either token.

Source: live app, uptick-fi.pages.dev/vault/aapl, 30 days to 2026-10-17. Dollar split derived from the same figures. contracts/SECURITY.md, contracts/script/DeployAll.s.sol.

Four review rounds, each re-reading the last round's fixes. The fourth ended SHIP.

Round 1	1 High and 3 Medium, all closed	A same-block share lock and a spot-to-TWAP band against deploy sandwiches. Deposits priced at the lowest of Chainlink, TWAP and spot. A 24 hour owner queue. A corporate-action gate on the token's oracle pause and multiplier.
Round 2	Round 1 fixes confirmed	Swap floors include the pool fee, so 1% pools rebalance. Router deposits clear at $500, $2,000 and $10,000.
Round 3	TWAP bound set to 30 bp	Entry fee raised to 35 bp, so a deposit ahead of a price update does not pay. Exits work on every fee tier.
Round 4	SHIP: no Critical, High or Medium	Residuals are published with their measured bounds and the lever that moves each.

80 of 80
security tests pass on a fork of the real pools

50
mutation checks: break a guard, see red, restore, see green

24 h
queue on every owner setting, with the full calldata emitted

In kind
exit stays open when everything else is closed

Source: contracts/SECURITY.md and the four reports in contracts/ (SECURITY-REVIEW, SECURITY-REREVIEW, SECURITY-REVIEW-3, SECURITY-REVIEW-4, 2026-10-20). Contracts final, creation-code hash pinned.

Agents read the same evidence the app shows.

list_vaults	Every vault with its door, fee APR and kept APR.
get_vault_evidence	Replay pools, gate rule, reason and swap count.
prepare_deposit	Unsigned transactions. The user signs and sends.
prepare_withdraw	Unsigned exit transactions, in kind included.

One endpoint, MCP over Streamable HTTP. A closed vault returns its gate reason, so an agent never routes a deposit past the door.

GET /vaults/aapl, gate.reason

"Open: the weaker half of the 30-day replay kept 2.7% a year, at or above break-even, across 95,275 swaps."

tools/call prepare_deposit, id spcx, amount 10

{"error": "Closed: the weaker half kept -199.5% a year, below the -20% floor."}

GET /vaults/aapl, pools: fee APR, first half, held-out half

Pool	Fees	First	Held-out
v3 0.05%	18.8%	+2.7%	+3.9%
v4 0.3%	23.0%	+7.6%	+0.3%
v3 0.3%	11.3%	-16.4%	-12.8%

Evidence API and MCP: uptick-evidence.earn-shield-alerts.workers.dev; figures as keeper/src/evidence.ts builds them from keeper/data/replay.json (2026-10-22). llms.txt and the evidence API are open to any agent.

Source: keeper/src/evidence.ts on keeper/data/replay.json, api/src/mcp.ts, web/public/llms.txt.

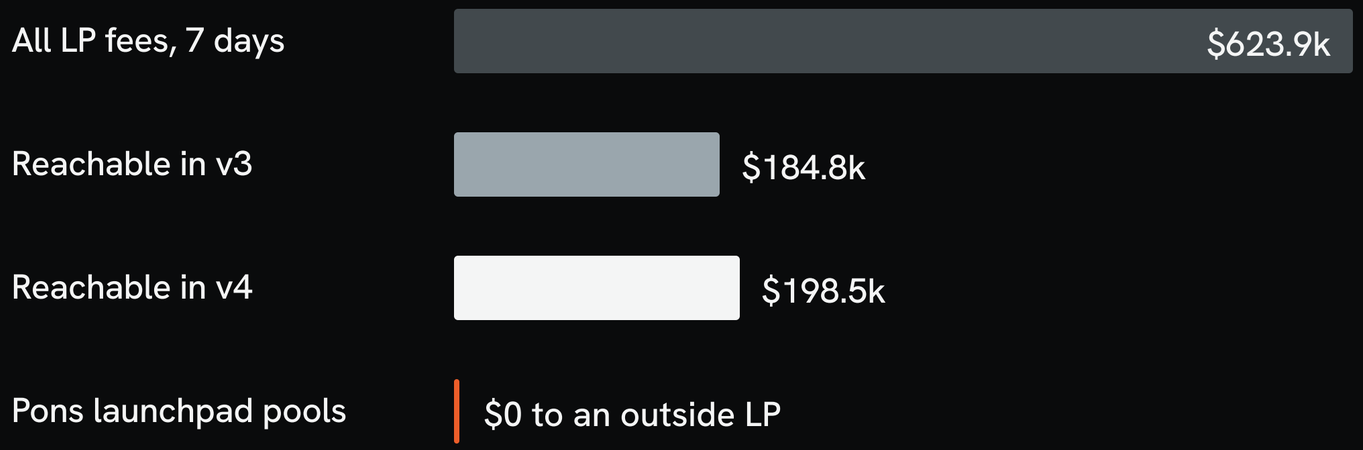

None of four vault codebases has a settings timelock or stock-split handling. Uptick has both.

Codebase	Owner settings	Stock split	Deposit priced from
AutoRange	24 setters, each takes effect at once	Raw balances and ticks, no multiplier	Pool spot
Arrakis V2	Manager, fee, pool and router change at once	Plain ERC-20 shares, no multiplier	Pool spot
Gamma	setFee, setTwapCheck, ownership: one transaction	Raw balances, no multiplier	Pool spot, optional 1 hour TWAP filter
Veda	Bounds, fees and roots apply in the same transaction	No ERC-8056 or rebase logic	Stored rate, no maximum age
Uptick	**24 hour queue**, calldata emitted, void after 7 days	**ERC-8056 gate**: price-checked paths close around each multiplier change	Lowest of Chainlink, TWAP and spot

Session-fee hooks (Fables, SessionFeeHook, Bellswap, ClosingBell) price swaps. Range vaults pick bands by hand. Uptick publishes the calibration for every token and opens a door only where it holds.

Source: competitors/*/STUDY.md with file and line citations (Arrakis V2, Gamma Hypervisor, Veda BoringVault, AutoRange). Uptick: contracts/SECURITY.md.

The fees sit in more than one pool. The v4 adapter widens the pot a vault can reach.

$488.40M of Stock Token volume moved through Uniswap v3 and v4 on the 17 tokens in 7 days. Launchpad pools pair a stock with a memecoin across 256 traded pools and $9.95M, and take their fee in the hook.

PLTR, band 350 bps

The v3 0.3% pool keeps -20.3% in its weaker half and stays closed.

+12.8%

What the PLTR v4 1% pool keeps in its weaker half in the same replay, net of the PoolManager's protocol fee. PLTR launches open on it.

Built: the v4 position adapter

StockVaultV4 holds a position in a hookless v4 pool, with the same guards and the same evidence gate.

Source: docs/research/founder-house/vaults/VENUES.md (2026-10-13 to 2026-10-20, read over the public RPC). keeper/data/replay.json, PLTR pools.

The app, the evidence API, the MCP endpoint and the launch film are live.

Shipped

App	uptick-fi.pages.dev, 17 vaults, each with its gate and reason
Evidence API	JSON for every vault, plus the MCP endpoint and llms.txt
Launch film	The weekend finding and the three doors, on screen
X	@uptickfi
Contracts	Final, creation-code hash pinned, deploy ready

The plan, by date

Oct 23	10 holder interviews, 3 signed holder LOIs, 6 integration conversations, 1 integration LOI, each counted from a file
Oct 23 to 25	Founder House, Singapore
Every week	The replay refreshes and each vault opens or closes on its new halves

Source: live app and API read 2026-10-21. Dated targets: gtm/uptick/EVIDENCE.md and LAUNCH.md.

Every stock token on Robinhood Chain, earning. We are raising $2M to get there.

Kamal

Built StockVault, the keeper, the replay engine, the web app and the evidence API.
github.com/kamalbuilds

Four security reviews

Each round's fixes were re-read in the next, ending SHIP.

$2M pre-seed	A vault for every Stock Token the day it lists, on v3 and v4 pools, with an external audit and two engineers on the keeper and risk engine
12-month target	$50M of Stock Tokens earning in Uptick vaults, and vault shares accepted as collateral by Robinhood Chain lenders
From this room	Holders who will size a first deposit, and the range vaults, lenders and wallets that carry the kept APR

Uptick shows which of your stock tokens can earn, and how much you would keep.
