ROBINHOOD CHAIN · CHAIN 4663

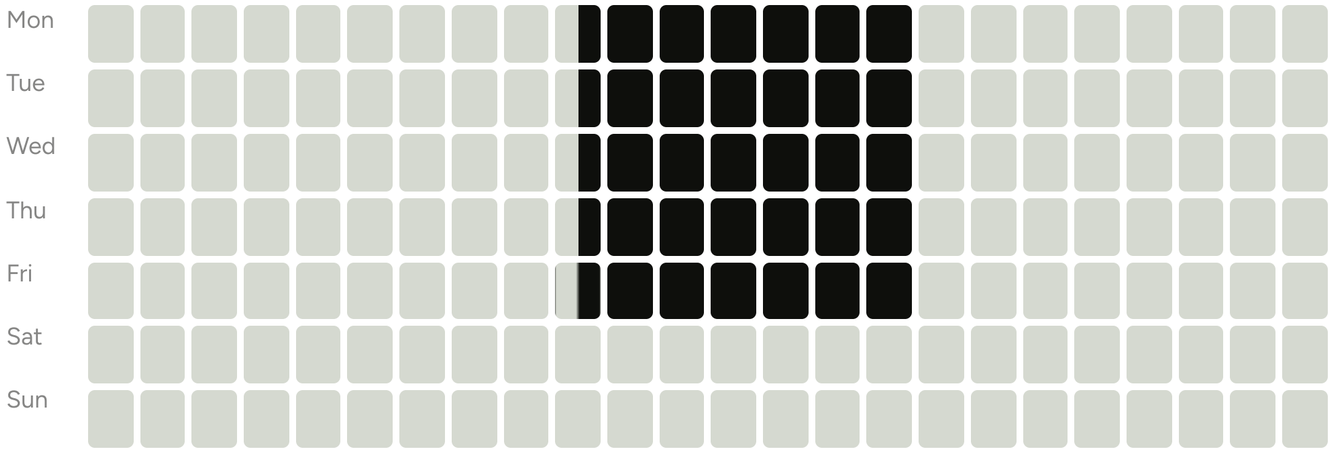

Uptick

Deposit NVDA once. Earn the trading fees of its pool, with fees priced by whether Wall Street is open.[1]

Sources. [1] stock-vaults-app/README.md. Strip: one week, 7 rows by 24 hours, NYSE regular session (Mon to Fri, 09:30 to 16:00 ET) in lime.

Stock Tokens trade all week. The NYSE price exists 6.5 hours a day.

The dark cells are the NYSE session. The other 81% of the week's hours have no equity price discovery.[2]

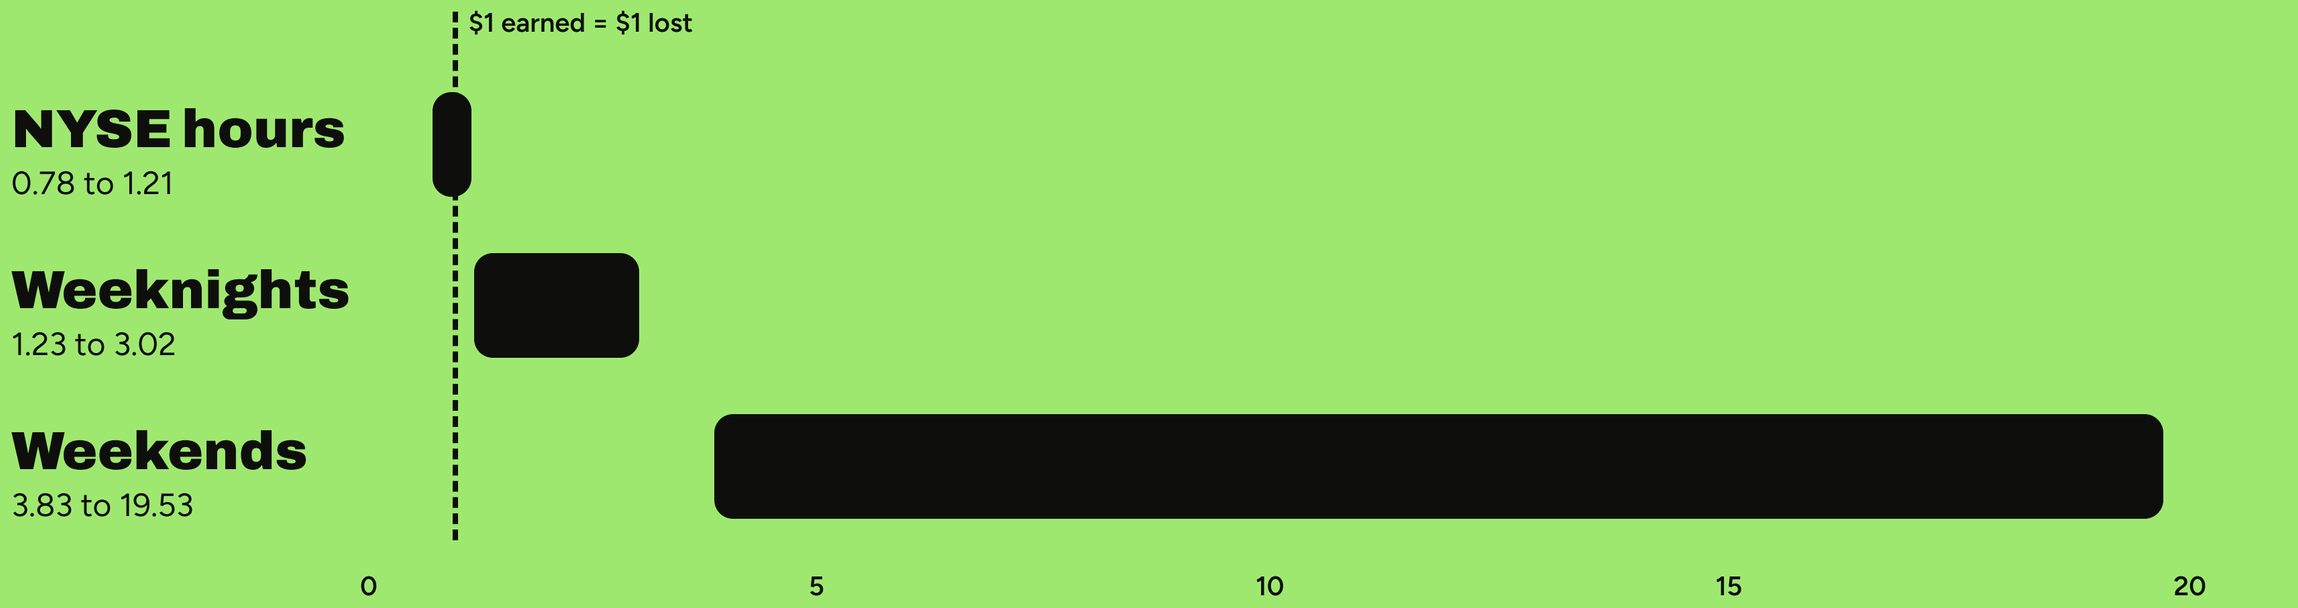

78%

of Stock Token flow arrives outside NYSE regular hours.[3]

Pools that trade them charge one flat fee at every hour. LPs are priced wrong at both ends.[1]

Sources. [1] stock-vaults-app/README.md. [2] derived: 5 days x 6.5 h = 32.5 of 168 hours (19%). [3] docs/research/founder-house/PLATFORM-TRUTH.md, verdict line 3 and Gap 3 (78%, interval 69 to 85).

Weekend liquidity earns $3.83 to $19.53 per $1 it loses. NYSE hours earn $0.78 to $1.21.[1]

Weekend liquidity is the most profitable and the cheapest to underwrite. NYSE hours are where a flat fee underprices the risk. Uptick prices both ends.[1]

Sources. [1] spikes/stock-vaults/FINDINGS.md and stock-vaults-app/README.md. Fee earned per $1 lost to informed traders (1 hour markout), static ±2% vault, NVDA, SPCX and TSLA pools, 5.1M swaps, 2026-08-24 to 10-17. Range ends are per-pool values: NYSE 0.78 (SPCX) to 1.21 (NVDA); weeknights 1.23 (NVDA) to 3.02 (SPCX); weekends 3.83 (NVDA) to 19.53 (TSLA).

One deposit. The pool's fees come back to the holder.

HOOK

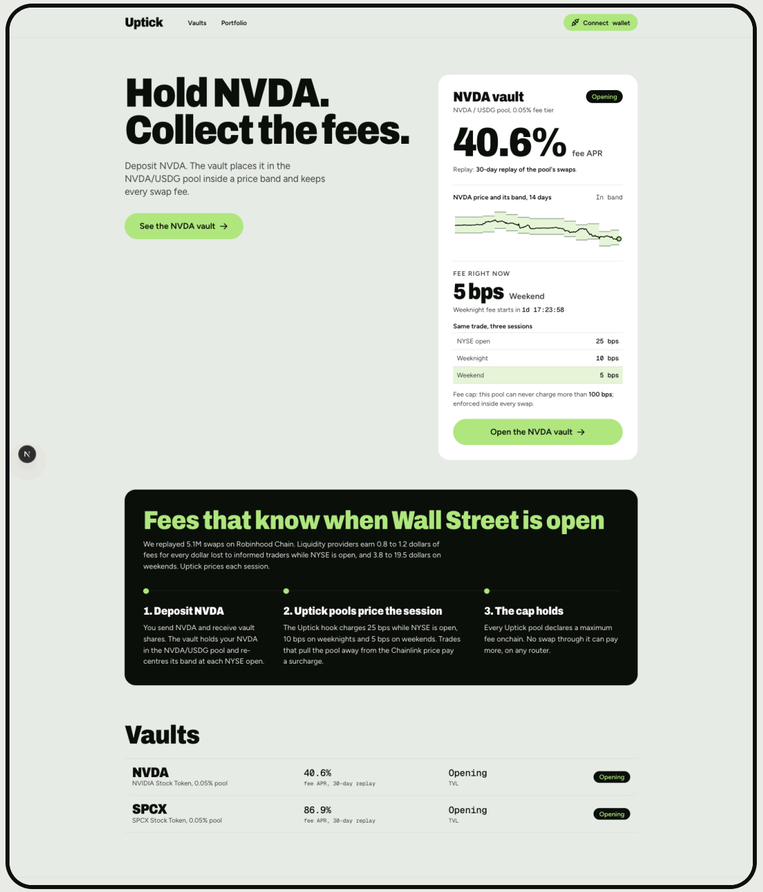

UptickHook sets the LP fee per swap from the market session and the gap to Chainlink, and declares a maximum it enforces.[1]

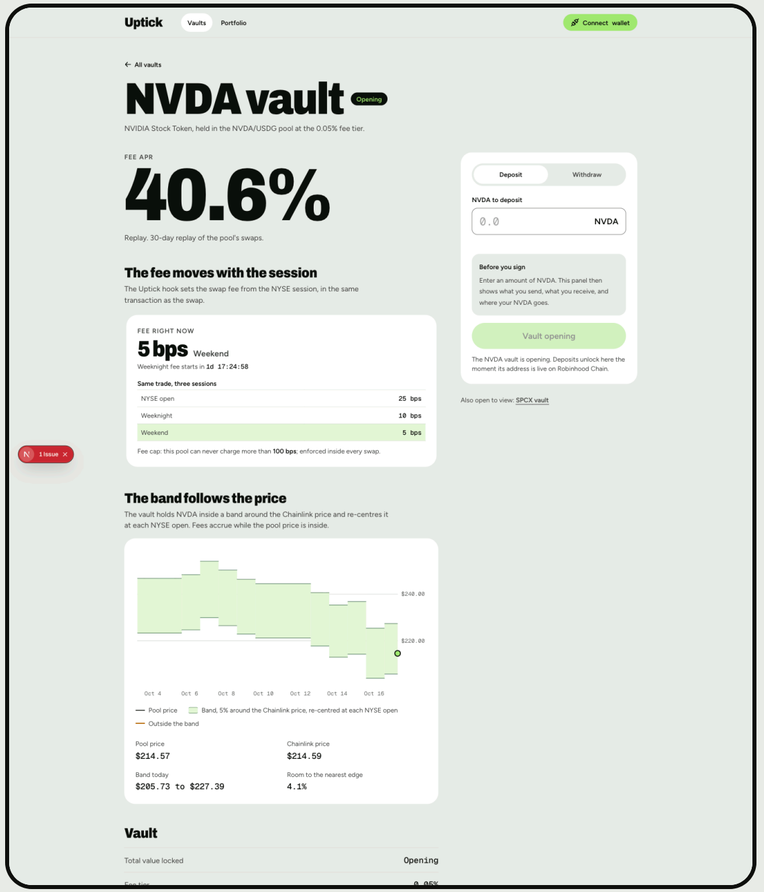

VAULT

StockVault, an ERC-4626 vault per Stock Token. One position, recentred at the NYSE open.[1]

APP

Vaults, deposit and redeem, portfolio. Exit always pays both tokens.[1]

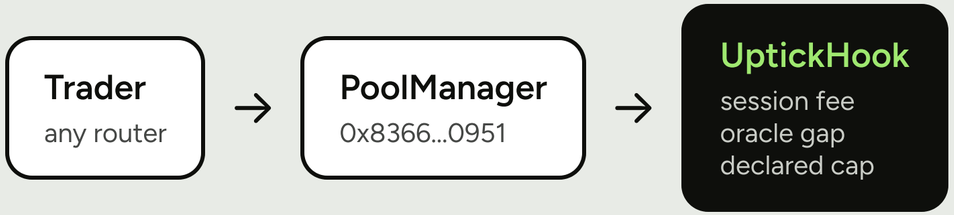

Sources. [1] stock-vaults-app/README.md, docs/ARCHITECTURE.md. Screens: web/screens/home-1440.png and vault-nvda-1440.png, the running web app (top of page shown).

A hook that prices the risk. A vault that collects the fees.

PRICING LAYER · UNISWAP V4

1. beforeSwap reads the session and the Chainlink reference.
2. Fee = session base plus a surcharge for trades that open a gap.
3. afterSwap reverts with **TakeExceedsCap** above the declared maximum, on every router.[1]

VAULT LAYER · ERC-4626

1. Every value-in and value-out passes an oracle gate: Chainlink fresh, TWAP and spot within bounds.
2. Keeper recentres daily at the NYSE open, 13:35 UTC in EDT, after an **eth_call** simulation passes.
3. **redeemInKind** pays both tokens with no oracle, no swap, no pause.[1]

Sources. [1] stock-vaults-app/docs/ARCHITECTURE.md (components, data flow per swap and per deposit). Interactive diagram: docs/architecture.html.

The cap holds on a mainnet fork: 200 of 200 over-cap swaps revert.[1]

0 wei

take accounting vs a no-hook pool, per leg, 64 swaps per shape[1]

2 of 2

nested self-swap directions blocked with NestedStateChange[1]

~25k

gas added per swap by the cap[1]

5.1M

swaps replayed over 54 days on NVDA, SPCX and TSLA pools[2]

```
$ forge test # fork of chain 4663
cap 250, 3% hook : 200/200 revert TakeExceedsCap
cap 300, 3% hook : 200/200 pass
3.01% under cap 300 : reverts 60/60
2.99% under cap 300 : passes 60/60
delete the cap revert : tests go red; restore : green
```

40.6%

NVDA vault fee APR, 30 day replay, daily recentre, 5% band[3]

Sources. [1] spikes/capped-hooks/FINDINGS.md (verdict table, mutation run, gas table). [2] spikes/stock-vaults/FINDINGS.md. [3] stock-vaults-app/README.md, Evidence table (keeper /vaults).

Hooks carry 74.5% of v4 trades on the chain. Quoted fees no longer tell the price.[1]

$15B

cumulative Stock Token volume in the first 100 days since the July 1 mainnet[2]

80%

of 84K hooks labelled malicious by 0x[1]

$1.2M

taken in 49 hours by hooks keeping 5 to 11% while pools quote 0 to 1%[3]

Uptick declares its maximum and the pool enforces it inside the swap. Stock Tokens, Uniswap v4 hooks and Chainlink equity feeds sit on one chain.

Sources. [1] stock-vaults-app/README.md (Bitquery 74.5%; 0x 80% of 84K). [2] docs/research/founder-house/QWEN-LANE.md line 63 (cryptobriefing, Oct 12 2026). [3] docs/research/founder-house/OUTREACH-fomo-gmgn.md, hidden-take table.

189,012 wallets hold NVDA on the chain. Their tokens sit idle.[1]

$47M

of top-10 Stock Token supply already sits in AMM pools on the chain[2]

$1,054.8M

Robinhood Chain TVL[3]

$30.6M

in 87 Raydium stock-token LP pools on Solana, 97% TVL-weighted 1-day fee APY[4]

@WAZZCRYPTO, 62.0K FOLLOWERS, OCT 15

"All my stock lps have been printing and have been in range for 1 month+ I could have gotten almost 3 digit yield in size"[4]

[3] same file, DefiLlama historicalChainTvl, last point 2026-10-16. [4] docs/research/founder-house/vaults/DEMAND.md, section 2 and 3 (DefiLlama yields API, 2026-10-17; X status 2110798586254344623).

Session fees exist. None pairs them with an enforced cap and a vault that collects.[1]

APPROACH	WHAT IT PRICES
Covered-call vaults, fixed-yield LP, ETF baskets, agent range managers	Weekly expiry, fixed rate, a basket, a 5 minute loop. Not the session.[1]
Session-fee hooks	Higher fee when the market is closed. ClosingBell-Hook, ETHOnline 2026 Uniswap track.[2]
Uptick	**Session, oracle gap, an enforced cap, and the vault that collects.**

Enforced cap.
200 of 200 over-cap swaps revert.[3]

Fees calibrated on data.
5.1M swaps, three pools, 54 days.[4]

Integrated vault.
Deposit once; oracle-gated in and out.[5]

Robinhood Chain specifics.
24/5 Chainlink equity feed, NYSE calendar with DST, USDG.[5]

REVENUE, AS ARITHMETIC

performance share × vault TVL × fee APR

Fee APR is observed per vault from FeesCollected events; one vault per Stock Token, so revenue scales with the number of tokens and the TVL in each.[1]

Sources. [1] stock-vaults-app/docs/ARCHITECTURE.md, "Data flow per deposit" step 4 and Stats API row. The model is a design of the contracts above; the share rate is a vault parameter.

NVDA first, then SPCX. The holders and the asks are already there.

1

First vaults

The NVDA vault, then SPCX, built for the 189,012 NVDA holders.[1]

2

Robinhood Chain ecosystem

6 chain LPs reporting results, 10 explicit asks for stock-token yield, 9 accounts already lending or LPing stock tokens.[2]

3

Judges and partners

Arbitrum Founder House, Singapore, Oct 23 to 25 2026.[3]

Hook builders get a registry they can read: CapRegistry records each hook's declared maximum, so routers and integrators check what a hook may charge.[4]
