Robinhood just made Stock Tokens collateral on Morpho. Posted there, they earn nothing.

@RobinhoodCrypto on X, 2026-10-22, 55,663 views.

A Stock Token posted as collateral backs a loan and does nothing else.

Stock Token collateral on Morpho Blue

$3.88M

0.7% of the chain's $551M of Morpho collateral. $1.69M is borrowed against it. Morpho API, 2026-10-24 02:58 UTC.

Context: Morpho Blue holds $609.5M on the chain.

Earned by a Stock Token posted as collateral

$0

Morpho Blue does not lend collateral out. The holder pays interest and the token sits.

The Stock Tokens on it sit idle.

Source: x.com/RobinhoodCrypto/status/2113270580472381515, captured 2026-10-24. blue-api.morpho.org, chain 4663, 134 markets whose collateral is one of the 17 Stock Token addresses, 2026-10-24 02:58 UTC. Context: DefiLlama, 2026-10-23.

Holders and traders ask for yield on Stock Tokens.

nibel.base.eth
@Nibel_eth

Now that we have tokenized stocks onchain, we should have builders on:

1) borrow/lend markets, where users can get yield by lending stock or pay yield by shorting stock

Wazz
@WazzCrypto

I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks

jack nomads
@JackNomadsGOD

stocks on solana is a massive narrative but it needs composability to truly scale

tokenized equities like xStocks need to plug directly into defi lending markets so users can earn yield on SPYx or NVDAx while holding them

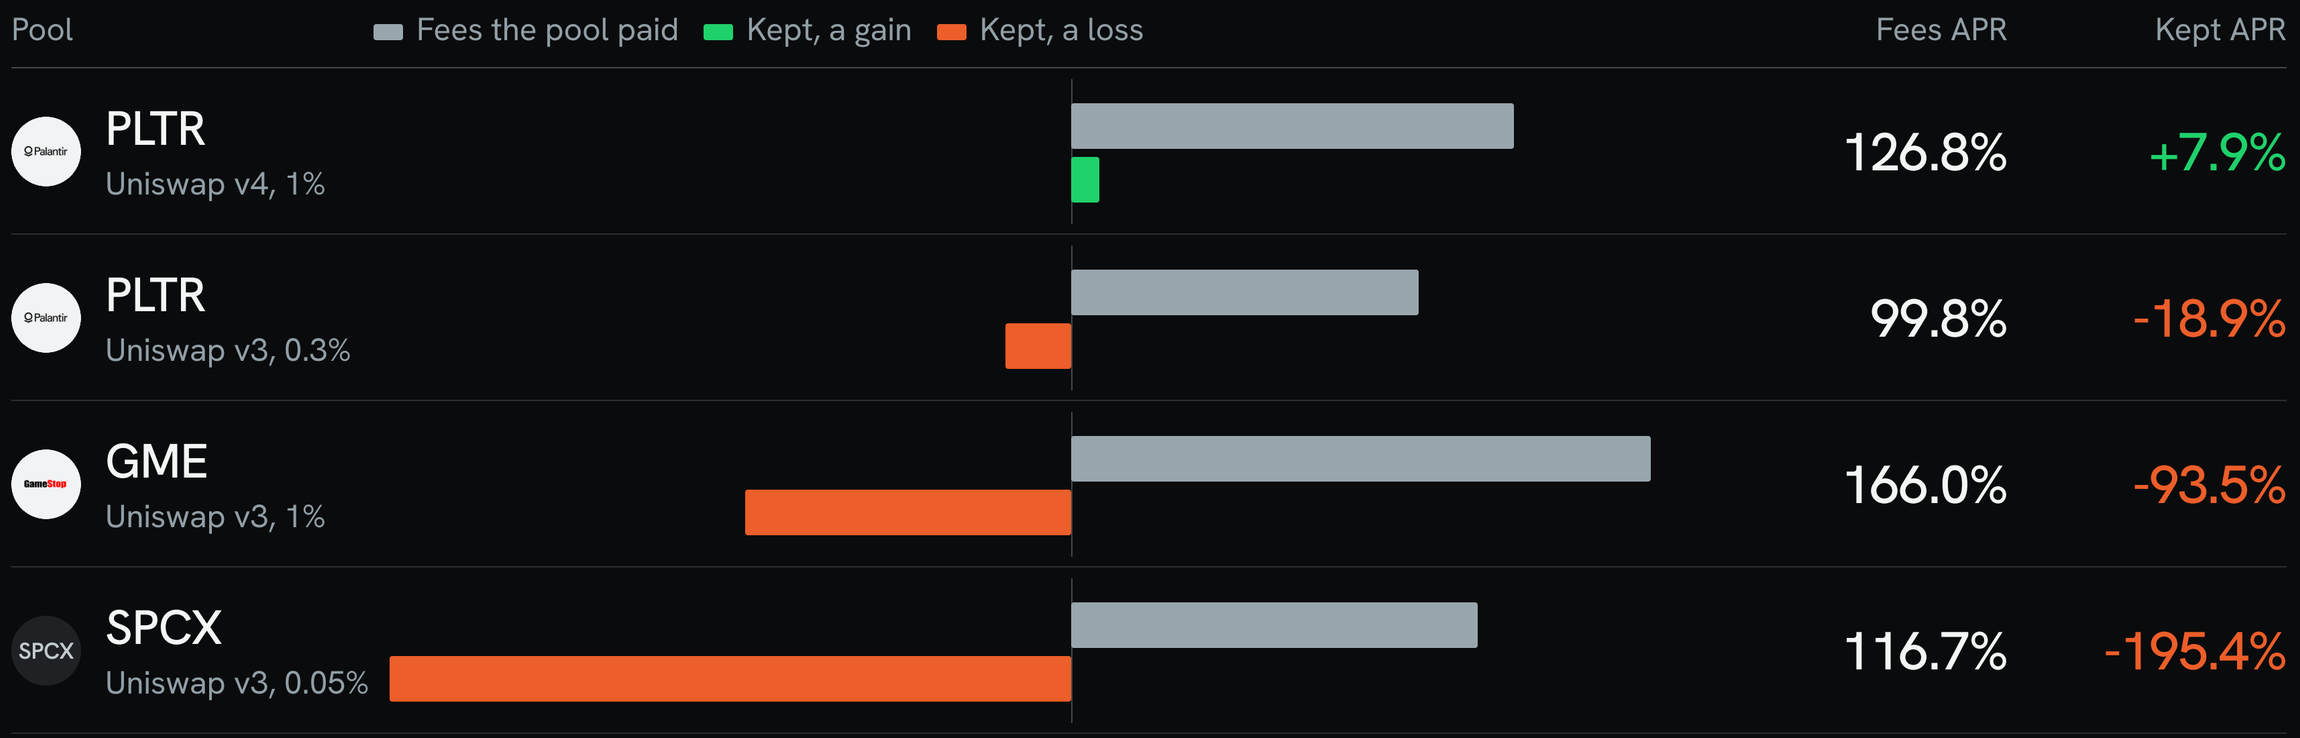

Mosi VP of Vibes
@mosi3274080

Putting tokenized stocks to work for yield is the feature I'd actually use. Holding idle shares never made sense.

189,012 wallets hold NVDA and 114,222 hold SPCX on Robinhood Chain.

Source: the four posts on x.com, captured 2026-10-24, crops end after the lines quoted; URLs, dates and follower counts in the notes. Holders: Blockscout, 2026-10-16, PLATFORM-TRUTH.md.

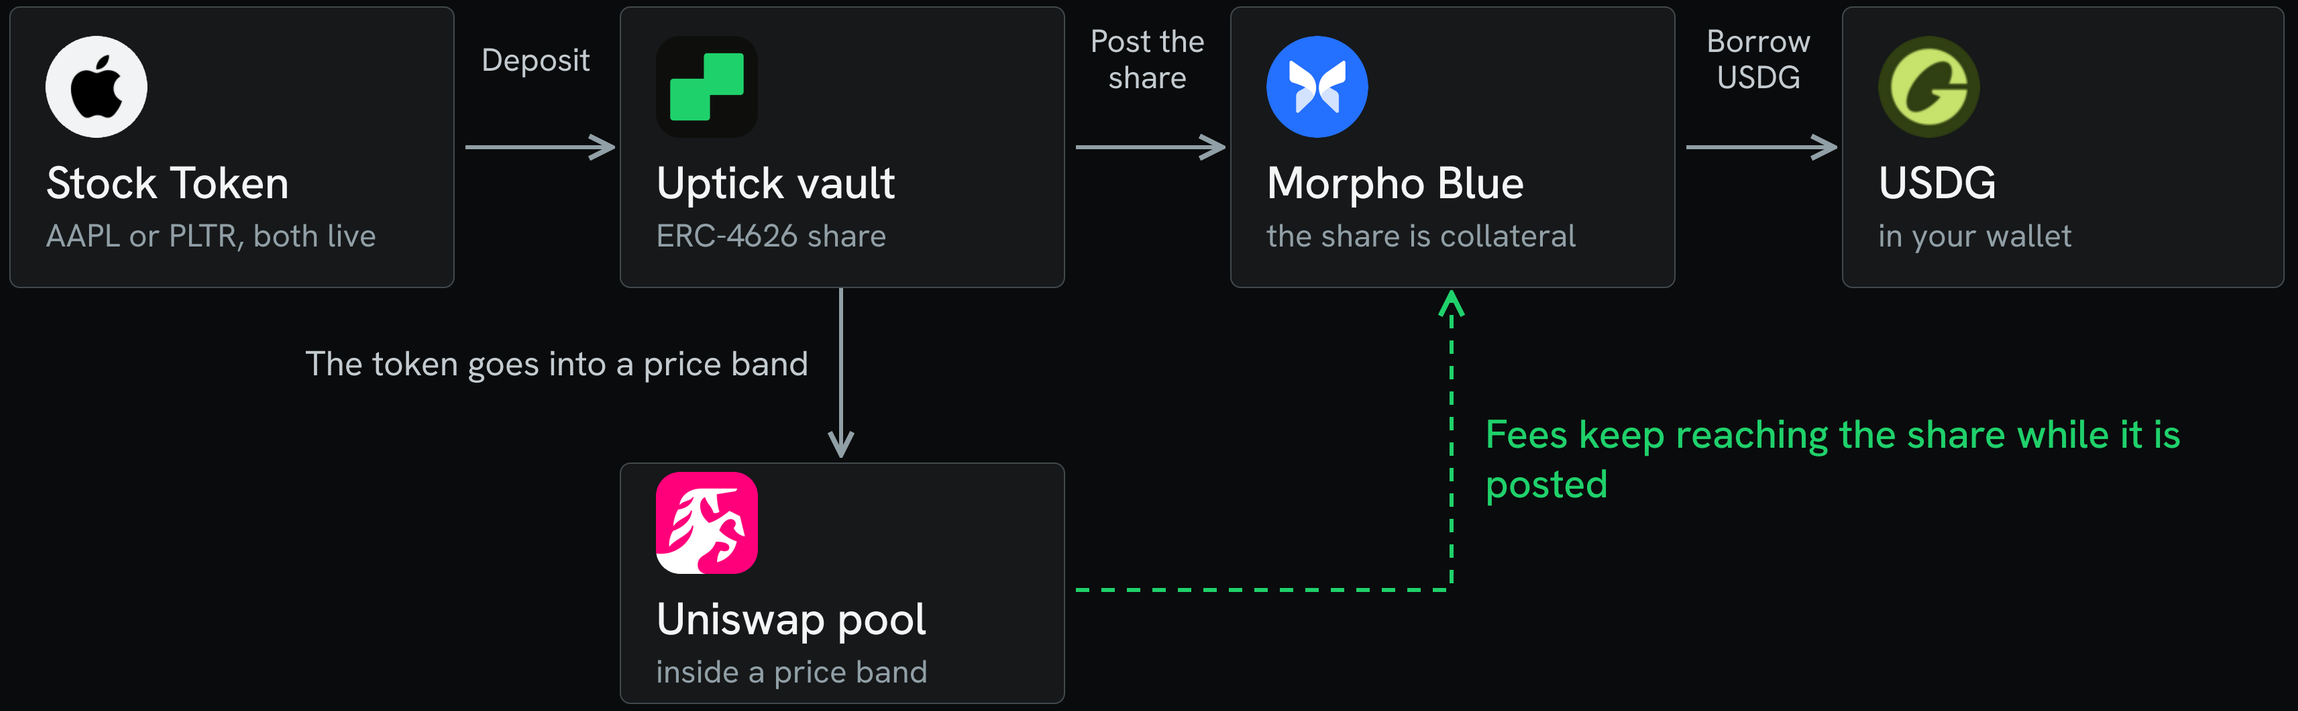

We replayed 3,059,881 swaps from the chain's pools. Fees are not yield.

The replay sets the door. Keeps money: open. Loses a little: reduced. Loses most: closed.

Source: keeper/data/replay.json, held-out half, 15 days to 2026-10-17, annualised. Kept is fees less losses to informed traders and rebalancing cost. web/lib/vault-universe.json for the swap count.

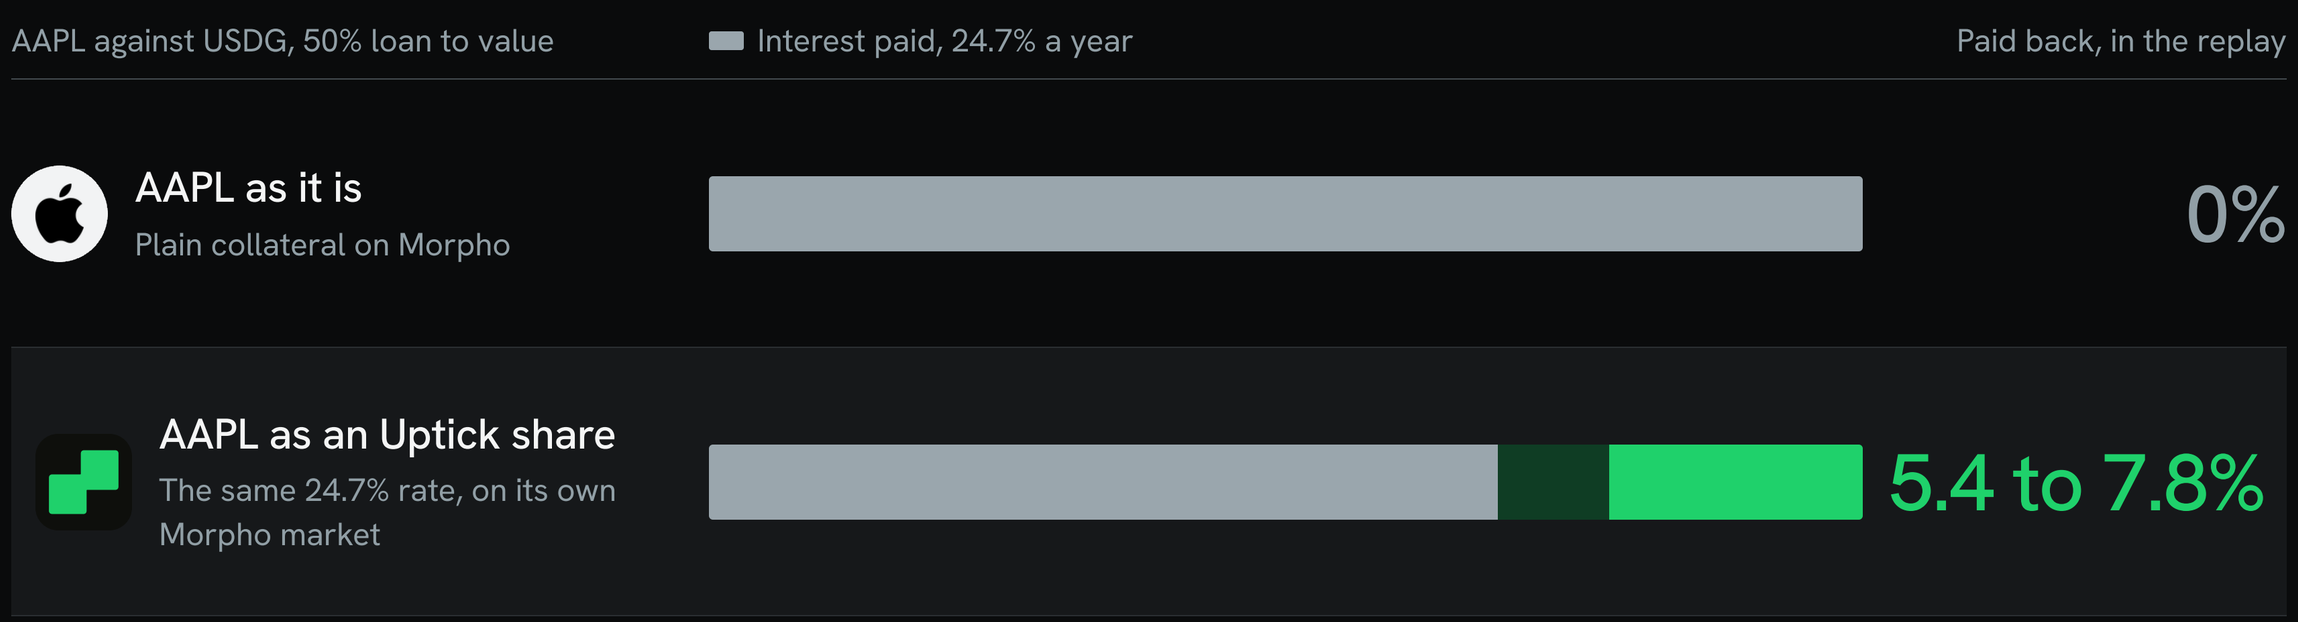

One deposit does two jobs: it earns in a Uniswap pool and backs a loan on Morpho.

Excited to see what gets built on top. Johann Kerbrat, Robinhood Chain, on the Morpho launch, X, 2026-10-22.

Source: x.com/JohannKerbrat/status/2113272709333536936, captured 2026-10-24. contracts/SECURITY.md, scripts/fork-demo.sh.

In the replay, an Uptick share pays back a fifth to a third of the loan interest.

One read of the market, 2026-10-23 16:56 UTC. The rate moves and fee income varies.

The share earns while it is collateral, so the loan costs less in the replay.

Source: blue-api.morpho.org, chain 4663, market 0xdeb4782d (62.5% LLTV), 2026-10-23 16:56 UTC. AAPL kept: web/lib/vault-universe.json.

From a pasted address to a loan on the same share.

/check for any address: read from the chain, nothing to connect or sign

0xc9E2...4e52

Holds $1,862 of Stock Tokens doing nothing. Uptick puts all of it to work.

PLTR, open

9.4658 PLTR at $196.74

+$145 a year

in the replay

Then the loan, on a fork of today's chain and the real Morpho Blue contract

8,691 USDG borrowed

against 42.6 AAPL posted as an Uptick share, limit 9,148 USDG.

- A market for the share: live on mainnet, block 96394191
- A lender supplies USDG
- Deposit, post the share, borrow
- A 3% push on the pool leaves the price alone
- A stale price closes deposits, exits stay open
- A price drop liquidates, and the lender is repaid in full
- A price older than 97 hours cannot liquidate

Every screen reads the chain, and one command runs the loan end to end.

Source: uptick-fi.pages.dev/check, address 0xc9E2...4e52, 2026-10-24, rebuilt as slide text. scripts/fork-demo.sh, 7 steps asserted, on a fork of Robinhood Chain at block 96347563. The AAPL share market: deployments/4663.json morphoMarkets, block 96394191.

A 3% push on the pool moved the collateral price 0.002%. A price read from the pool moved 2.63%.

Collateral price moved by the same 3% push on the pool

Uptick share, priced from Chainlink alone

0.002%

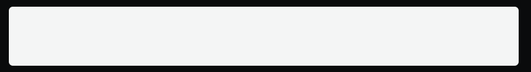

Control: a price read straight from the pool

2.63%

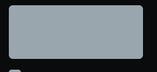

412 contract tests, 141 of them security tests, and six written security reviews.

Further fall before a lender loses anything, from a loan at the limit

29.6%

Worst weekend gap in 123 days

7.75% USO

0.68% AAPL

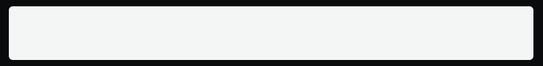

A liquidation repays the debt in full and the liquidator comes out ahead

USDG repaid on the debt

5,767

USDG value of the seized shares, 14.9% more

6,628

Pushing the pool does not move the price, and the buffer is several times the worst weekend gap on record.

Source: docs/FORK-DEMO.md steps 17 and 19 (scripts/fork-demo.sh). contracts/SECURITY.md, keeper/data/weekend-gaps.json (2026-06-22 to 2026-10-23). docs/facts.json.

An Uptick share does both: it earns the pool fees and it can be posted on Morpho.

Four ways to hold a Stock Token	Earns pool fees	Can be posted
Uptick share An ERC-20 priced from Chainlink	✓	✓
Plain collateral Posted on Morpho, it earns $0	—	✓
AutoRange One position per vault, no share	✓	—
Fables A v4 position is an NFT	✓	—

Kept a year in the weaker half of the 30-day replay: the Fables pool and the pool Uptick chose

11 of 12

tokens where the Uptick pool keeps more than the Fables pool.

INTC	Fables -320.7%	Uptick pool -2.2%
NVDA	Fables -81.8%	Uptick pool -6.8%
META	Fables -32.7%	Uptick pool -10.5%
AAPL	Fables -5.0%	Uptick pool +2.7%

The replay picks the pool. Morpho takes the share.

Source: keeper/data/fables-replay.json (2026-10-23) against web/lib/vault-universe.json, weaker half of the 30-day replay; 12 tokens have a replayable Fables pool.

All 17 Stock Token pools paid liquidity providers $623.9k in a week. That is about $32M a year.

17 Stock Tokens
12 pass the replay, 5 closed

→

$488.4M
traded in 7 days

→

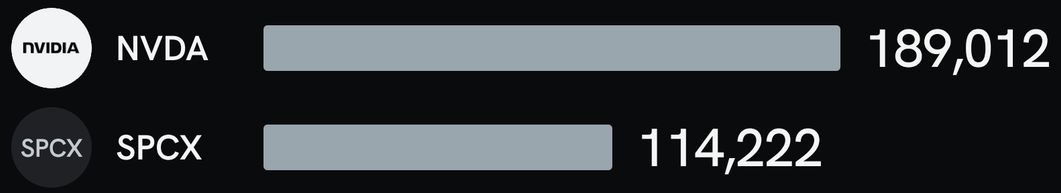

$623.9k
paid to LPs in 7 days

→

$32.4M
a year, one week times 52

Blocks 87,352,064 to 93,292,983, Uniswap v3 and v4, all 17 tokens including the 5 closed. The week is measured; the year is that week at the same rate.

Wallets holding a Stock Token on the chain

Blockscout, 2026-10-16. About half of the top ten tokens' supply sits in AMM pools.

How Uptick is paid

Up to 10%

of fees, charged only where holders still keep money after it. 0% at launch.

The fee flow is measured, and the loan rail on top of it is new.

Source: docs/research/founder-house/vaults/VENUES.md (2026-10-13 to 2026-10-20), annualised by 52. PLATFORM-TRUTH.md (Blockscout, 2026-10-16).

2 builds

The factory can only create the two reviewed vault builds, StockVault and StockVaultV4

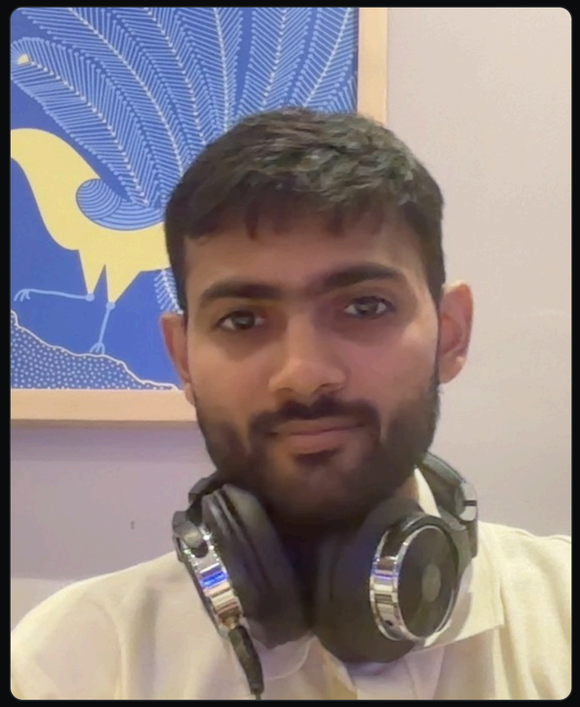

10 tools

on one live MCP endpoint, from list_vaults to plan_weekend_hedge

Mainnet, verified and capped at $5,000 a vault, with an agent endpoint answering live.

Source: deployments/4663.json, Morpho market created at block 96394191 (tx 0xe3d688e3...f85500). Sourcify v2 API, VaultFactory.vaultCodeHash, contracts/pinned-hashes.json (block 96379763). MCP endpoint, 2026-10-24.

One founder built every layer, from the replay to the loan. This round adds two engineers.

Kamal

Founder, blockchain developer

Built every layer of Uptick: replay engine, vault contracts, web app, agent API

7 contracts deployed and verified on Robinhood Chain mainnet, 2026-10-24

712 public repositories on GitHub since 2021, github.com/kamalbuilds

Earlier product: Ava, a portfolio manager of AI agents for DeFi, getava.xyz

Hiring with this round

Engineer, keeper
Recentres every vault after each session

Engineer, risk engine
The replay, the gate, the caps

Everything on the Live slide has one author. Two engineers take the keeper and the risk engine.

Source: this repository (docs/facts.json). GitHub API, users/kamalbuilds, public_repos 712, read 2026-10-24.

We are raising a $2M pre-seed to open a vault on every Stock Token.

Live on Robinhood Chain

7	contracts, verified on Sourcify
2	vaults, AAPL and PLTR, each capped at $5,000
1	Morpho market on the AAPL share
12	vaults pass the replay: 3 open, 9 reduced

$2M pre-seed, spent in this order

1. **A vault for every Stock Token the day it lists**
   The 12 vaults that pass the replay deployed, then each new listing, on v3 and v4 pools.
2. **An external audit**
   Of the contracts that hold depositors' tokens, on top of six written reviews.
3. **Two engineers**
   On the keeper that recentres every vault and the risk engine that sets every door.

12-month milestones

The 12 vaults that pass the replay live

Caps lifted as the pools deepen

Lenders on the AAPL share market: a curator such as Steakhouse, a lender such as Zona

Appendix

The evidence behind each slide, and the two Open House canvases.

Demand and pool pages	The yield products measured, and the fee APR a pool page shows.
Doors and business model	Where a year of AAPL fees goes, the three doors, the launch caps.
The Morpho read	Borrow APY on four Stock Token markets, read 2026-10-23.
Price ranges and sessions	One price range for every token loses. In the 30-day replay, weekends pay $2.95 per $1 lost, NYSE hours $0.99.
Gate table	All 17 tokens, price range, weaker half and door.
Doing it yourself	Hold, one position set once, or an Uptick vault, on AAPL, GOOGL and PLTR.
Code, venues, security, agents	Four codebases compared, the Fables replay, the venue census, six review reports, the MCP responses.
Open House canvases	Go-to-market and product, filled in for Uptick.

Source: this repository. Every figure carries its file on the slide it appears on.

Seven of the eight Stock Token yield products measured take USDG or pairs.

Seven take USDG or pairs	AutoRange, StonkBrokers Smart LP, TickerSpring, Crossbow, Arrowfarm, EARN and EZManager. A holder sells the stock to join.
One sells covered calls	HedgeHood, weekly covered calls on NVDA: $66,236 in the product, 6 share holders.
Live on another chain	u/SolBrothers_ on r/solana, 2026-09-14, on a Kraken and Kamino product: "Clients holding SPYx, QQQx or NVDAx can deposit them and earn yield in the same asset while keeping market exposure."

Uptick takes the Stock Token itself. The holder keeps the stock exposure while it earns.

Source: vaults/COMPETITORS.md, read 2026-10-17. reddit.com/r/solana/comments/1wg6c93, 2026-09-14.

A pool page shows fee APR. It does not show what an LP loses to fast traders.

AMD

131.6%

PLTR

160.4%

SPY

3.5%

Fee APR as one live vault page shows it, 46 times apart on one page, with no loss column.

On the chain's AAPL pool, 13.8 points of 18.7% a year in fees went to informed traders.

Source: TickerSpring Vaults page, copied as displayed, vaults/COMPETITORS.md, 2026-10-17. AAPL: web/lib/vault-universe.json, 30 days to 2026-10-17.

Deposit the Stock Token itself. See what you keep. Exit in kind any time.

No sale to join

The vault takes AAPL, NVDA or PLTR, not USDG and not a pair.

Fees beside what you keep

Every vault page shows both side by side, before you sign.

Both tokens come back

Exit in kind has no oracle, no swap and no pause in the way.

Where a year of AAPL fees goes: the pool pays 18.7%

13.8%
lost to informed traders, 1 hour markout

1.7%
spent recentring each day

3.3%
kept by depositors

Source: web/lib/vault-universe.json, AAPL, 30 days to 2026-10-17. contracts/SECURITY.md for exit in kind.

Every vault sits behind one of three doors.

Open

3 vaults take any amount

PLTR, AAPL and GOOGL kept money in both halves of the replay.

Reduced

9 vaults take up to $25,000 a deposit

The weaker half sits between -20% and break-even.

Closed

5 vaults take none

The weaker half kept less than the -20% floor.

Exit in kind is always open. Both tokens come back, with no oracle, no swap and no pause in the way.

Vault	Door	Weaker half
PLTR	Open	+7.9%
AAPL	Open	+2.7%
GOOGL	Open	+0.2%
SPY	Reduced	-0.2%
USO	Reduced	-0.9%
QQQ	Reduced	-1.3%
AMZN	Reduced	-1.9%
INTC	Reduced	-2.2%
AMD	Reduced	-4.7%
NVDA	Reduced	-6.8%
META	Reduced	-10.5%
MU	Reduced	-13.9%
TSLA	Closed	-25.8%
CRCL	Closed	-27.8%
MSTR	Closed	-43.0%
GME	Closed	-93.5%
SPCX	Closed	-195.4%

Source: web/lib/vault-universe.json, 30 days to 2026-10-17, weaker of two 15 day halves. contracts/SECURITY.md for exit in kind.

Depositors keep every fee at launch. A 10% share is sized by the vault caps.

Launching vault caps

$592,359

across the 12 launching vaults.

Uptick's share

0% to 10%

0% at launch. Switched on per vault, behind the 24 hour queue.

Entry fee, exit in kind

0.35% in, $0 out

The entry fee stays in the vault for the holders who stay.

Stock Tokens in the 12 vaults	Fees collected a year	Uptick at 0%	Uptick at 10%
$148,090	$63,531	$0	**$6,353**
$296,180	$127,061	$0	**$12,706**
$592,359	$254,123	$0	**$25,412**

A vault holds at most 20% of its pool's in-range liquidity, so revenue grows with pool depth and with each token that launches.

Source: web/lib/vault-universe.json (depositCapUsd and 30 day fee APR per vault, 42.9% weighted by cap, before losses to informed traders). Rows at 25%, 50% and 100% of the caps. contracts/script/DeployAll.s.sol (PERF_FEE_BPS, default 0), contracts/SECURITY.md.

Morpho already lends USDG against Stock Tokens at 20% to 25% a year.

Collateral	Loan limit	USDG supplied	Utilization	Borrow APY
AAPL	62.5%	$221,409	90.5%	**24.7%**
NVDA	62.5%	$729,089	85.2%	**23.5%**
SPCX	62.5%	$580,958	90.1%	**22.1%**
GOOGL	62.5%	$292,732	90.0%	**20.4%**

Every one of these loans is backed by collateral that earns nothing while the interest runs. An Uptick share posted in its own Morpho market earns its kept APR on top.

Source: blue-api.morpho.org, chain 4663, 512 markets, 2026-10-23 16:56 UTC. The largest USDG market at 62.5% for each collateral; rates are variable.

One price range for every token would lose: the range that kept +29.0% on NVDA kept -57.3% on GOOGL.

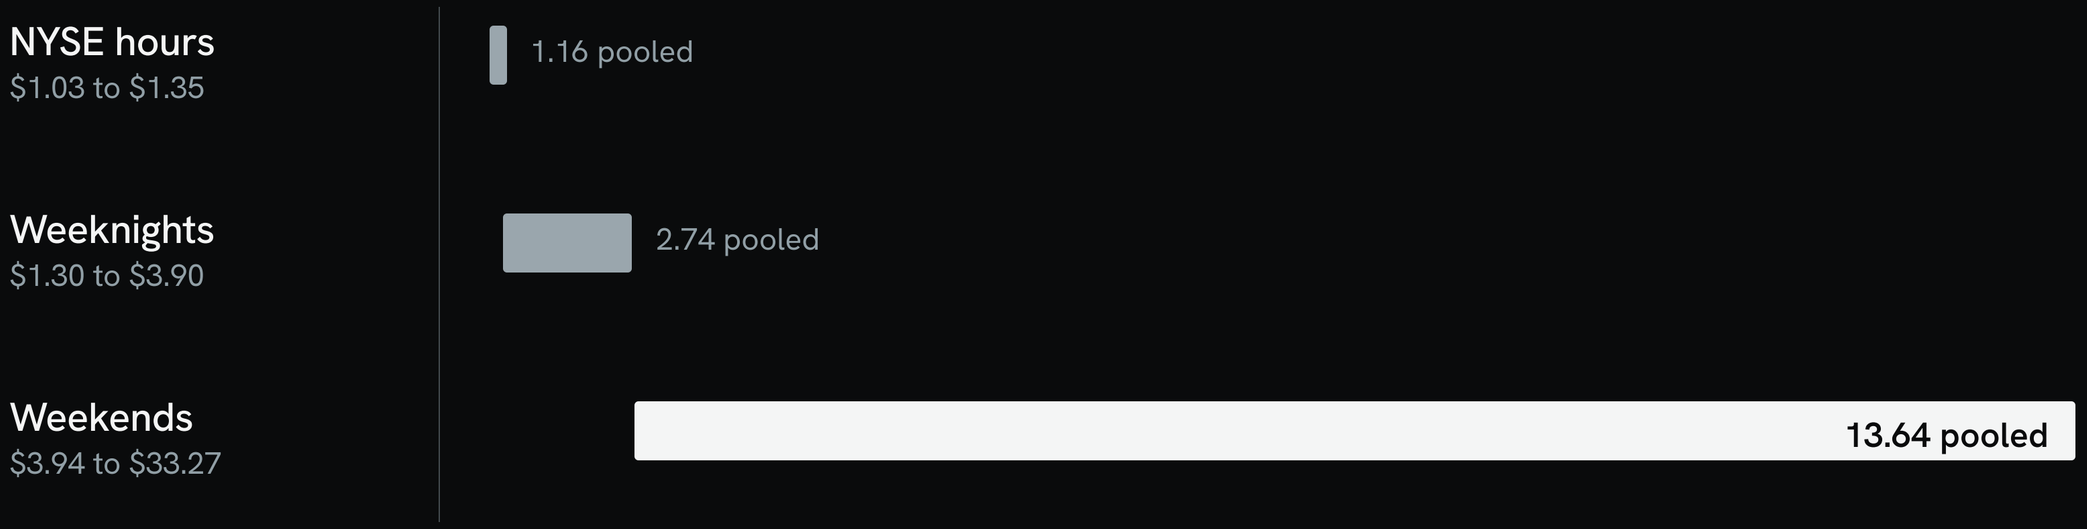

Kept APR in the calibration half, by price range. Each token picks its own, and the held-out half decides the door.

	Range ±1.5%	Range ±5%	Range ±20%
NVDA	+29.0%	+12.1%	+3.3%
AAPL	-10.1%	+2.5%	+1.6%
GOOGL	-57.3%	-5.5%	+0.2%

The picks: NVDA ±1.5%, AAPL ±7.5%, GOOGL ±20%. The ranges run from ±1.5% to ±20% across the 17 tokens.

Source: keeper/data/band-grid/grid-summary.json (calibration half, 2026-09-17 to 2026-10-02), keeper/data/params.json.

In a fixed range on NVDA, SPCX and TSLA from 24 August to 17 October, a weekend pays $13.64 per $1 lost to fast traders. NYSE hours pay $1.16.

5,113,049 swaps, three pools

NVDA, SPCX and TSLA on Robinhood Chain. The weekend ratio beats the NYSE ratio in 22 of 23 pool-weeks.

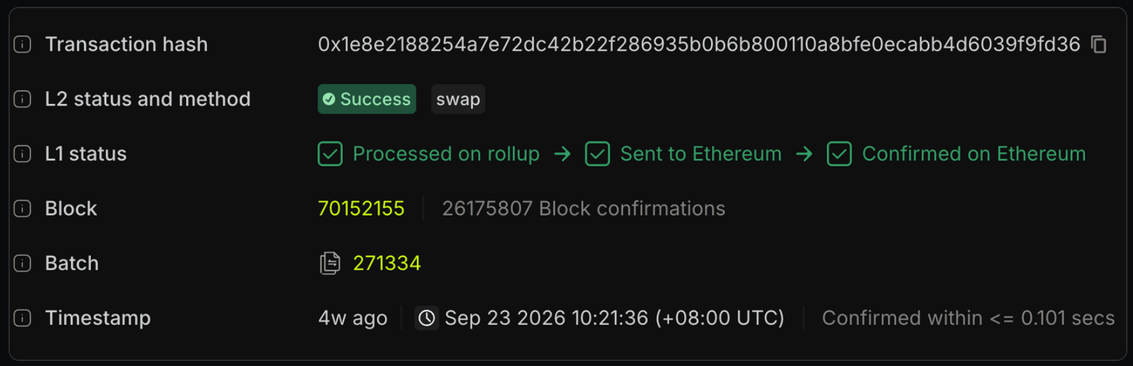

The engine drops what its own replay refutes

A schedule built on the clock met its bar on 0 of 3 tokens, and random session labels beat it in 64 of 64 cells. Twelve off-chain signals failed their shuffled control. Uptick acts on pool and price range, measured per token.

Source: README.md, spikes/stock-vaults/FINDINGS.md, spikes/offchain-signals/FINDINGS.md. Fee earned per $1 lost to informed flow, 1 hour markout, window 2026-08-24 to 2026-10-17.

With Nasdaq shut, one PLTR sale paid its pool $178.30 and cost its liquidity providers $241.83.

Sold, 10:21 PM New York	95.8 PLTR
Pool price, Chainlink price	$186.51, $184.67
Pool price an hour later	$183.75
Fee the pool earned	$178.30
Lost to liquidity providers	$241.83
Fee per $1 lost	$0.74

The transaction on Blockscout. The page clock reads +08:00; 10:21:36 there is 02:21:36 UTC. One routed trade made 7 pool swaps; this is its PLTR / USDG leg.

The replay counts every swap this way. Across the 17 pools the vaults sit in, a weekend earns $2.95 in fees for every $1 lost, NYSE hours $0.99.

Source: keeper/scripts/moment.py, keeper/data/replay.json window 2026-09-17 to 2026-10-17. Tx 0x1e8e2188254a7e72dc42b22f286935b0b6b800110a8bfe0ecabb4d6039f9fd36 read with cast tx on rpc.mainnet.chain.robinhood.com. Loss is the 1 hour markout.

Each token picks its price range on the first half. The second half decides the door.

AAPL kept +2.7% a year in its weaker half

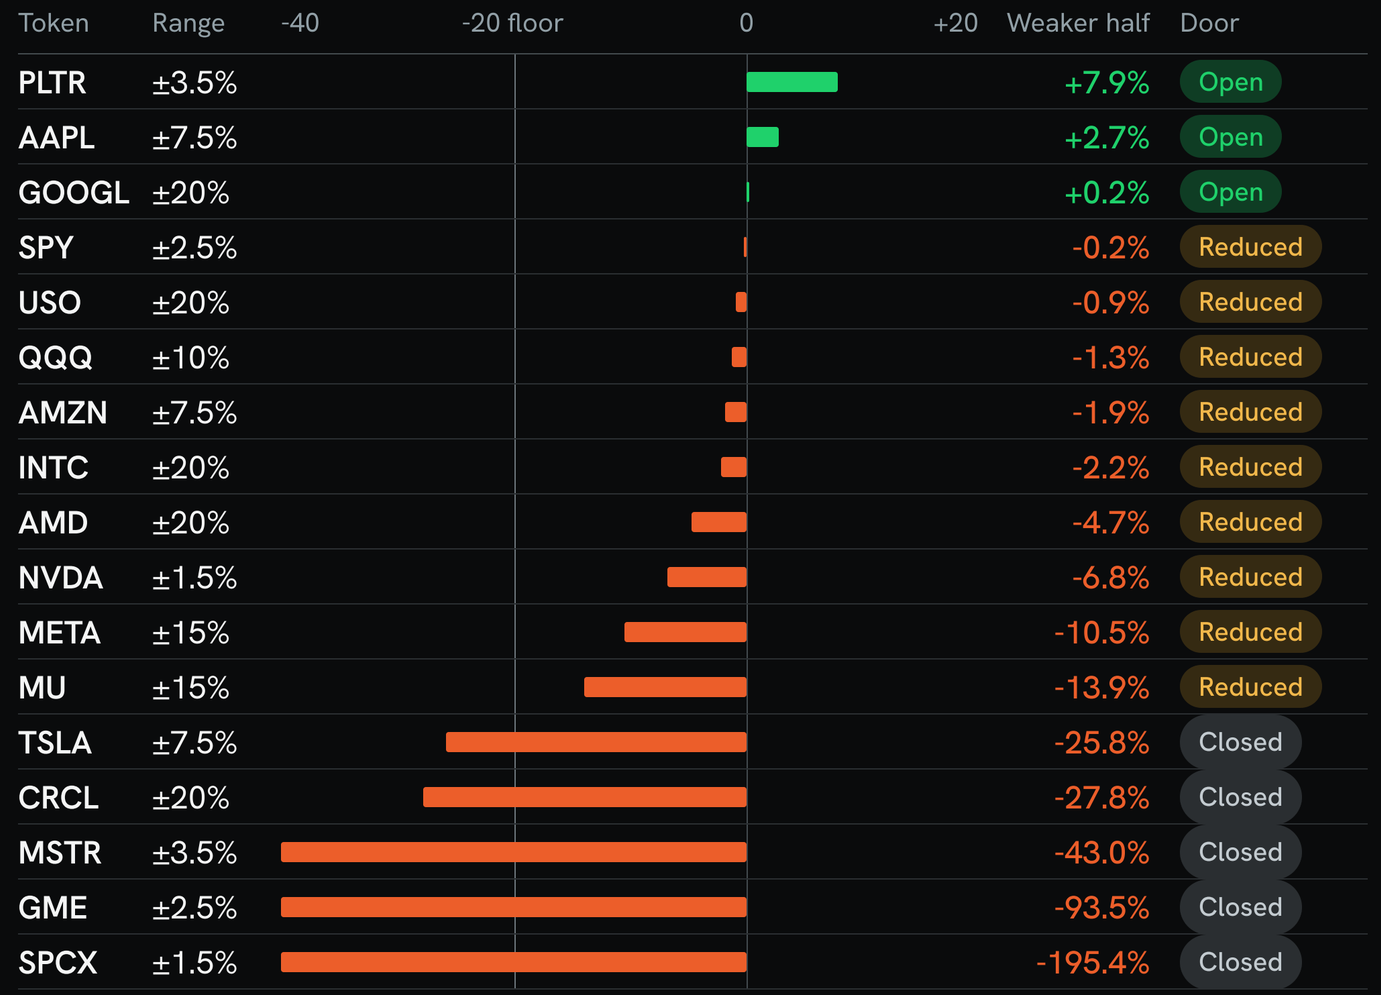

Range ±7.5%. First half +2.7%, held-out half +3.9%. Open. GOOGL keeps +0.2% and PLTR +7.9%, open too.

NVDA's tight price range kept +29.0% on the first half

The held-out half kept -6.8%. The gate shows the held-out number, so NVDA is reduced.

The conservative figure decides

The upper accounting bound sits beside it on every vault page.

Source: web/lib/vault-universe.json, keeper/data/params.json. Weaker half of two 15 day halves, 30 days to 2026-10-17. Bars end at -40.

A Uniswap position is an NFT that Morpho Blue cannot take. An Uptick share is an ERC-20 it can.

Token	Half read	Hold	Set once	Uptick vault	Set once kept a year	Vault kept a year
AAPL	first 15 days	-0.8%	+0.4%	**-0.1%**	+4.3%	**+2.7%**
GOOGL	first 15 days	-1.7%	-0.3%	**-0.8%**	+0.8%	**+0.2%**
PLTR	last 15 days	-1.9%	+0.0%	**-3.1%**	+0.0%	**+7.9%**

Hold, set once and vault are the 15-day return on the deposit in the half the gate reads. Kept is the gate's annualised unit, with the price drift left out.

Hold it, set one position, or deposit: the same 15 days. The share also recentres itself, and exit in kind pays out both tokens.

Source: keeper/data/diy-baseline.json, docs/DIY-BASELINE.md (all 17 tokens). Same swaps, markout and cost model as the gate; range bounds snapped to the pool's tick spacing.

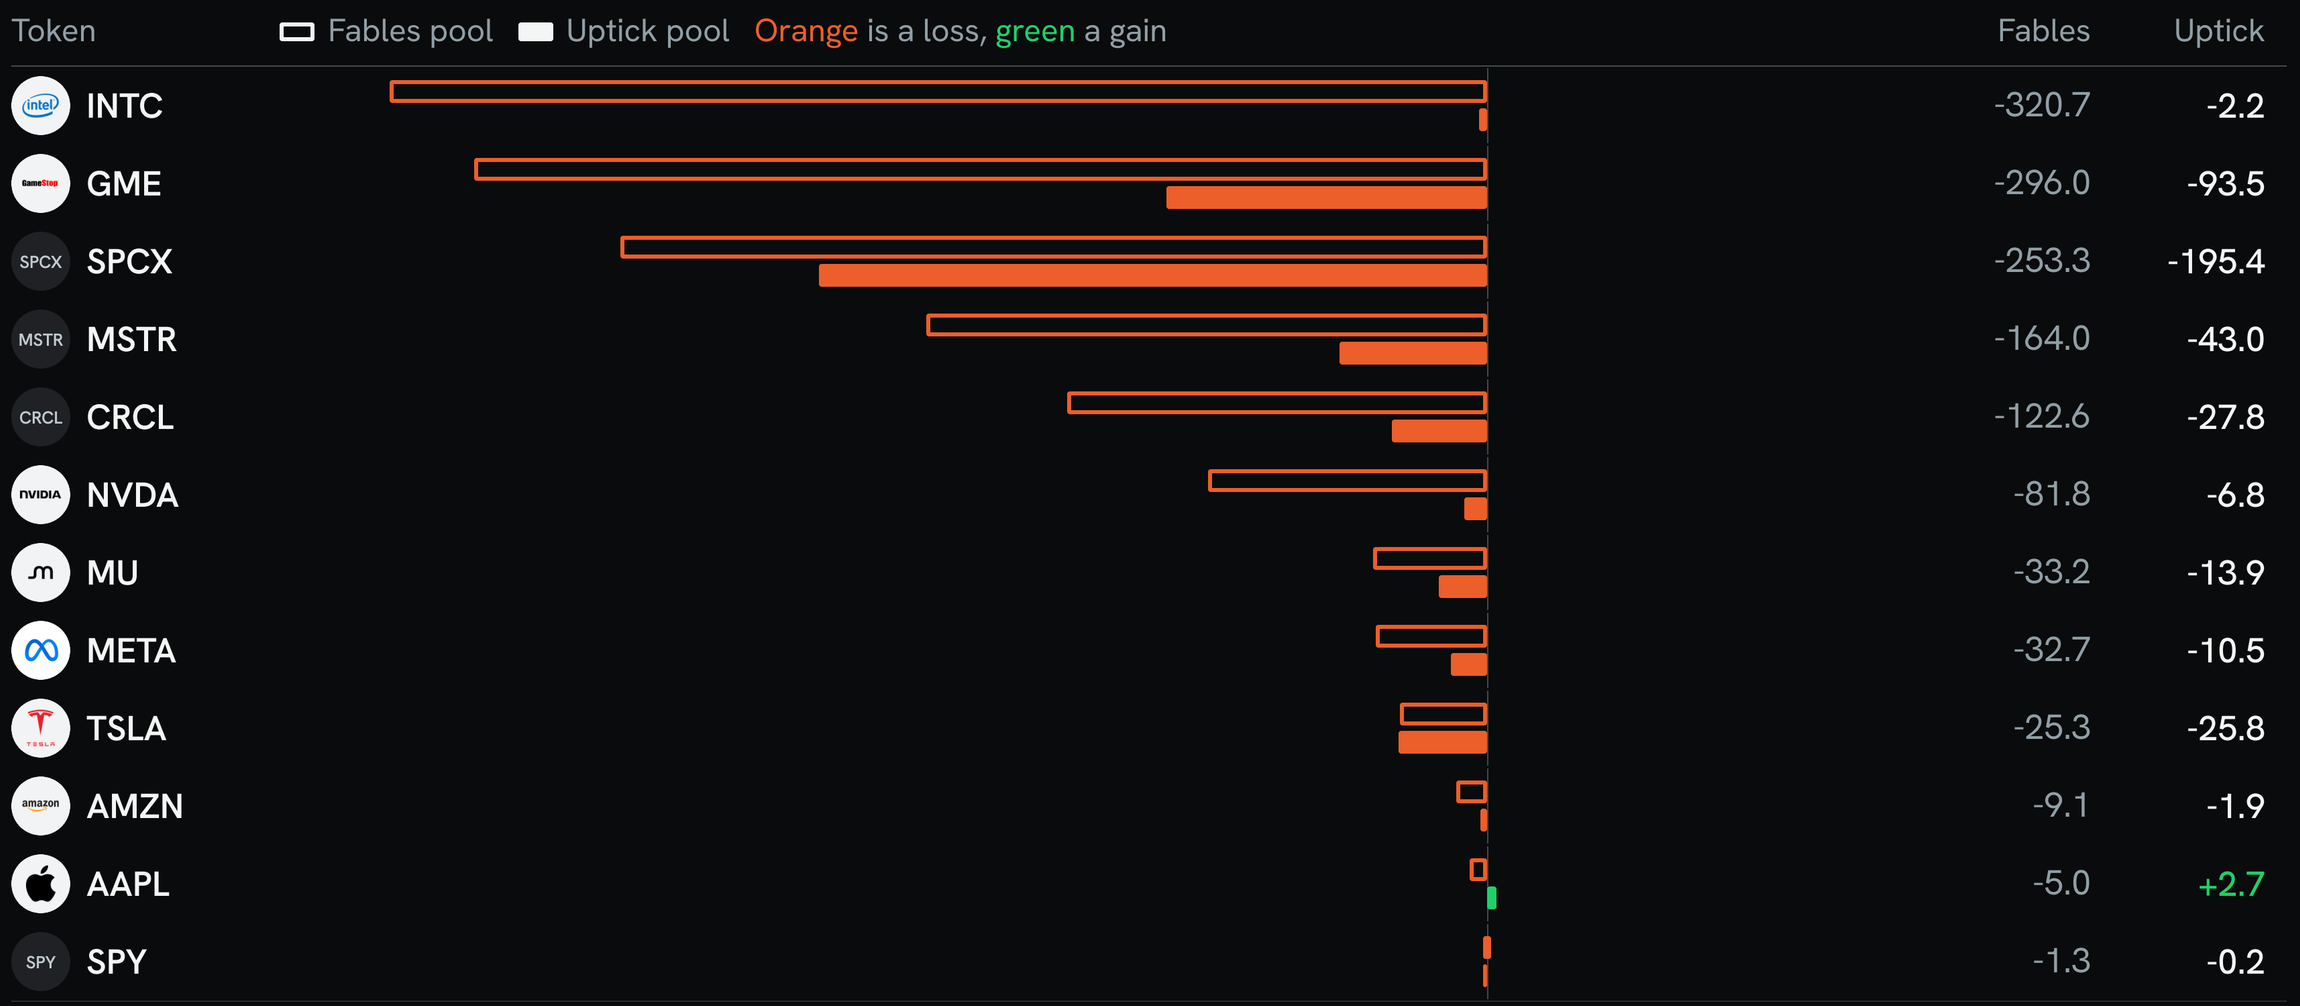

None of four vault codebases has a settings timelock or stock-split handling. Uptick has both.

Codebase	Owner settings	Stock split	Deposit priced from
AutoRange	24 setters, each takes effect at once	Raw balances and ticks, no multiplier	Pool spot
Arrakis V2	Manager, fee, pool and router change at once	Plain ERC-20 shares, no multiplier	Pool spot
Gamma	setFee, setTwapCheck, ownership: one transaction	Raw balances, no multiplier	Pool spot, optional 1 hour TWAP filter
Veda	Bounds, fees and roots apply in the same transaction	No ERC-8056 or rebase logic	Stored rate, no maximum age
Uptick	**24 hour queue**, calldata emitted, void after 7 days	**ERC-8056 gate**: price-checked paths close around each multiplier change	Lowest of Chainlink, TWAP and spot

Session-fee hooks (Fables, SessionFeeHook, Bellswap, ClosingBell) price swaps. Range vaults pick price ranges by hand. Uptick publishes the calibration for every token and opens a door only where it holds.

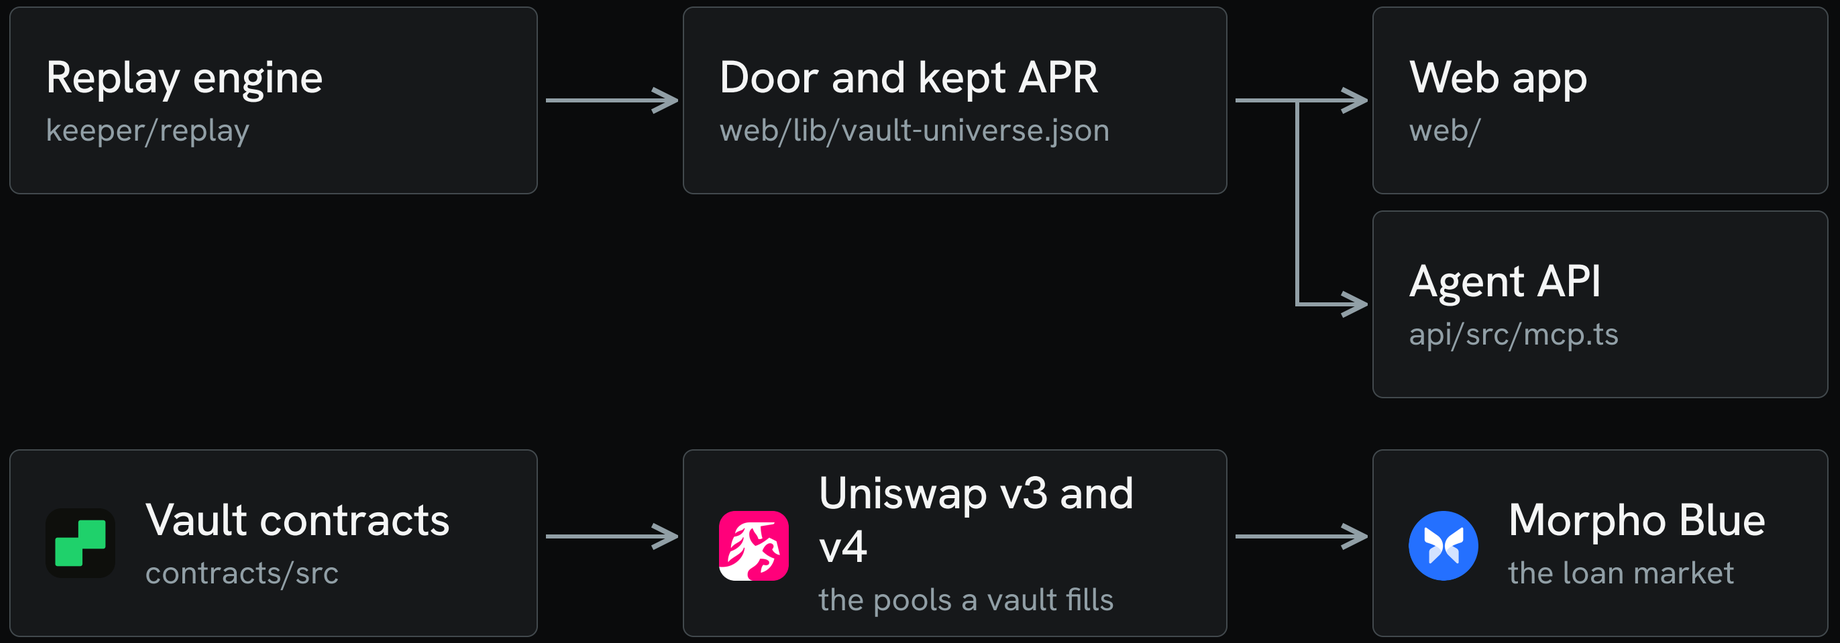

Source: competitors/*/STUDY.md with file and line citations (Arrakis V2, Gamma Hypervisor, Veda BoringVault, AutoRange). Uptick: contracts/SECURITY.md.

Fables pools and Uptick pools, token by token.

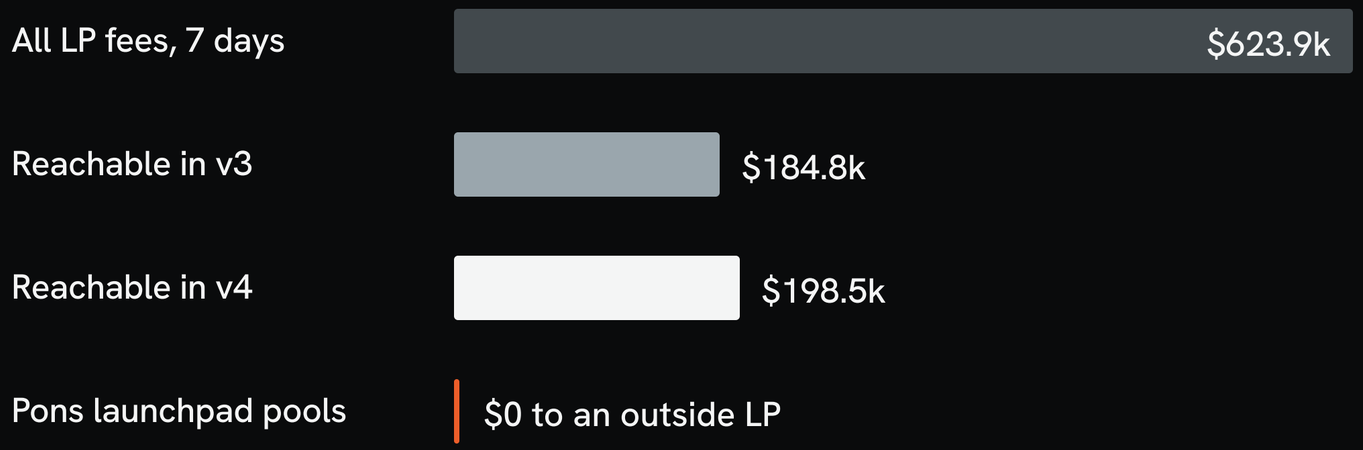

Source: keeper/data/fables-replay.json (2026-10-23) and web/lib/vault-universe.json, weaker half of the 30-day replay, kept APR a year in percent. One scale for every bar.

One repository holds the replay, the vaults, the app and the agent API.

Source: this repository. keeper/replay, contracts/src, web/, api/src/mcp.ts, scripts/fork-demo.sh.

The fees sit in more than one pool. The v4 adapter widens the pot a vault can reach.

$488.40M of Stock Token volume moved through Uniswap v3 and v4 on the 17 tokens in 7 days. Launchpad pools pair a stock with a memecoin across 256 traded pools and $9.95M, and take their fee in the hook.

PLTR, price range 350 bps

The v3 0.3% pool keeps -18.9% in its weaker half. The v4 1% pool keeps more, so PLTR deploys on v4 and opens.

+7.9%

What the PLTR v4 1% pool keeps in its weaker half in the same replay, net of the PoolManager's protocol fee. A token deploys on the venue whose pool keeps more in its weaker half: PLTR, SPY and USO sit on v4.

Built: the v4 position adapter

StockVaultV4 holds a position in a hookless v4 pool, with the same guards and the same evidence gate.

Source: docs/research/founder-house/vaults/VENUES.md (2026-10-13 to 2026-10-20, read over the public RPC). keeper/data/replay.json, PLTR pools.

Six review reports. Each vault round re-read the last round's fixes and round four ended SHIP.

Round 1	1 High and 3 Medium, all closed	A same-block share lock and a spot-to-TWAP price range against deploy sandwiches. Deposits priced at the lowest of Chainlink, TWAP and spot. A 24 hour owner queue. A corporate-action gate on the token's oracle pause and multiplier.
Round 2	Round 1 fixes confirmed	Swap floors include the pool fee, so 1% pools rebalance. Router deposits clear at $500, $2,000 and $10,000.
Round 3	TWAP bound set to 30 bp	Entry fee raised to 35 bp, so a deposit ahead of a price update does not pay. Exits work on every fee tier.
Round 4	SHIP: no Critical, High or Medium	Residuals are published with their measured bounds and the lever that moves each.

141
security tests run on a fork of the real pools

50
mutation checks: break a guard, see red, restore, see green

24 h
queue on every owner setting, with the full calldata emitted

In kind
exit stays open when everything else is closed

Source: contracts/SECURITY.md and the six reports in contracts/ (SECURITY-REVIEW, SECURITY-REREVIEW, SECURITY-REVIEW-3, SECURITY-REVIEW-4, SECURITY-REVIEW-V4, SECURITY-REVIEW-ORACLE). Contracts final, creation-code hash pinned.

Agents read the same evidence the app shows.

list_vaults	Every vault with its door, fee APR and kept APR.
get_vault_evidence	Replay pools, gate rule, reason and swap count.
prepare_deposit	Unsigned transactions. The user signs and sends.
prepare_withdraw	Unsigned exit transactions, in kind included.

One endpoint, MCP over Streamable HTTP. A closed vault returns its gate reason, so an agent never routes a deposit past the door.

GET /vaults/aapl, gate.reason

"Open: the weaker half of the 30-day replay kept 2.7% a year, at or above break-even, across 95,275 swaps."

tools/call prepare_deposit, id spcx, amount 10

{"error": "Closed: the weaker half kept -195.4% a year, below the -20% floor."}

GET /vaults/aapl, pools: fee APR, first half, held-out half

Pool	Fees	First	Held-out
v3 0.05%	18.7%	+2.7%	+3.9%
v4 0.3%	22.2%	+7.7%	+0.5%
v3 0.3%	11.1%	-13.3%	-11.7%

Evidence API and MCP: uptick-evidence.earn-shield-alerts.workers.dev; figures as keeper/src/evidence.ts builds them from keeper/data/replay.json (2026-10-23). llms.txt and the evidence API are open to any agent.

Source: keeper/src/evidence.ts on keeper/data/replay.json, api/src/mcp.ts, web/public/llms.txt.

Go-to-market canvas

Arbitrum Open House Singapore

Team name

Uptick
Kamal, founder

One line

Deposit a Stock Token, earn the fees that survive, borrow USDG against the share.

Who buys, who uses

Buys and uses: Stock Token holders on Robinhood Chain, 189,012 of them on NVDA. Also uses: agents on the MCP endpoint. Carry the kept APR and list the share: curators, lenders and wallets.

First reachable audience

26 holders and LPs who posted about stock-token yield in the last 30 days, led by @WazzCrypto (62,039 followers) and @Nibel_eth (36,595).

3 distribution channels

1. Named DMs and replies on X
2. 15 minute calls with 18 projects
3. /talk interviews and the open evidence API

Core message

Robinhood made Stock Tokens collateral on 22 October. Fees are not yield: Uptick shows what you keep, and the share can be borrowed against.

Proof you need first

The first mainnet deposit into an open vault, one signed holder LOI and a lender on the AAPL share market.

The intro that helps

Arbitrum Foundation to **Gaëtan Thabot**, Robinhood Chain partnerships, to put the vault list in front of Stock Token holders.

5 named targets

1. @WazzCrypto, LPs stock tokens by hand
2. Steakhouse Financial (SebVentures): curate the first share market, $538.0M on the chain
3. Zona (DataLust): vault shares as collateral
4. AutoRange (elkiyo.eth): list Uptick vaults
5. Rabby (Galen Yuan): show vault positions

The ask this weekend

The Thabot intro, calls with Steakhouse and Zona, three holders sizing a first deposit. **uptick-fi.pages.dev/talk**

One line

Deposit a Stock Token, earn the fees that survive, borrow USDG against the share.

Who is this for

@WazzCrypto, 62,039 followers, LPs tokenized stocks on Robinhood Chain by hand: "I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks."

What they do today

Hold NVDA idle, or LP by hand: pick the pool, the fee tier and the price range, then read a fee APR with no loss column.

The wedge

Kept APR, measured per token on 3,059,881 replayed swaps, on a share Morpho can take as collateral. 3 open, 9 reduced, 5 closed.

Why now

22 October: Robinhood made Stock Tokens Morpho collateral, "any app can tap into these markets". Morpho Blue holds $609.5M of the chain's $1.14B.

Alternatives and gaps

HedgeHood: weekly covered calls on NVDA. TickerSpring, AutoRange: USDG in. Morpho: lenders earn, collateral does not. None shows kept APR.

Why onchain, why Arbitrum

Robinhood Chain is an Arbitrum Orbit chain. The Stock Token, its Chainlink feed and the USDG pool share one chain, so valuation and exit need no bridge. Agents read it over MCP.

First 5 to 10 users, named, reachable this month

@WazzCrypto, @Nibel_eth, @0xFent_, @JollyDinger, @cryptonoah11, @omarsaleh66, @0x_iroh, @0xlippit. Each one posted about stock-token LPs or yield in the last 30 days and has a message queued.

Ship this weekend

The first mainnet vaults. The 90 second demo: /check, Earn and borrow, fork-demo.sh. /talk interviews in the room.
