ROBINHOOD CHAIN · CHAIN 4663

Uptick

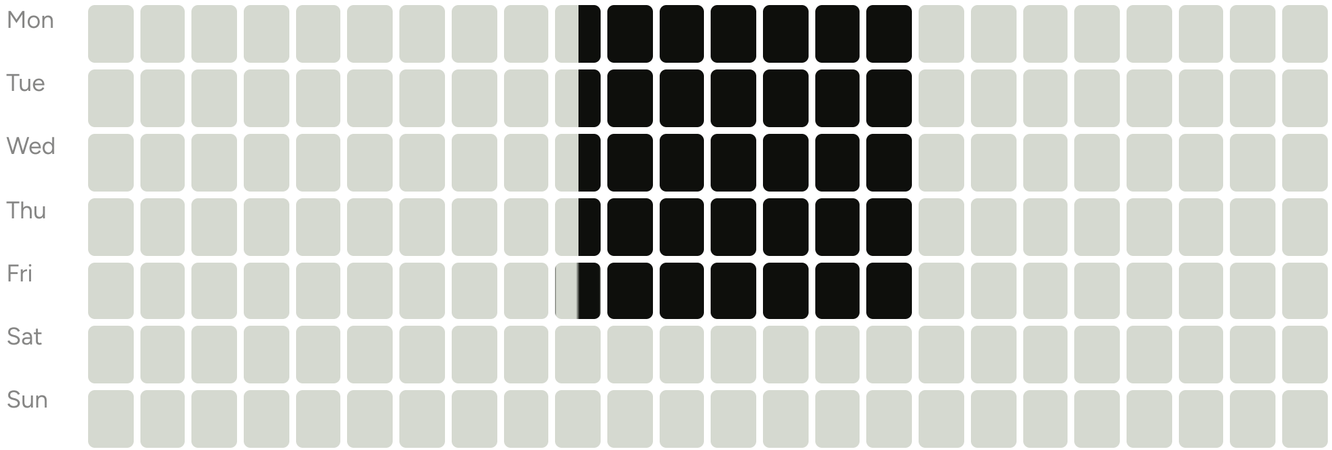

Put your stock tokens to work.

Deposit NVDA or GOOGL and earn a share of every trade's fee. Uptick shows what you earn and what you keep after losses to fast traders, and opens a vault only where 5.1 million past trades say it holds up.[1]

Sources. [1] stock-vaults-app/README.md. Strip: one week, 7 rows by 24 hours, NYSE regular session (Mon to Fri, 09:30 to 16:00 ET) in lime.

Stock Tokens trade all week. The NYSE price exists 6.5 hours a day.

The dark cells are the NYSE session. The other 81% of the week's hours have no equity price discovery.[2]

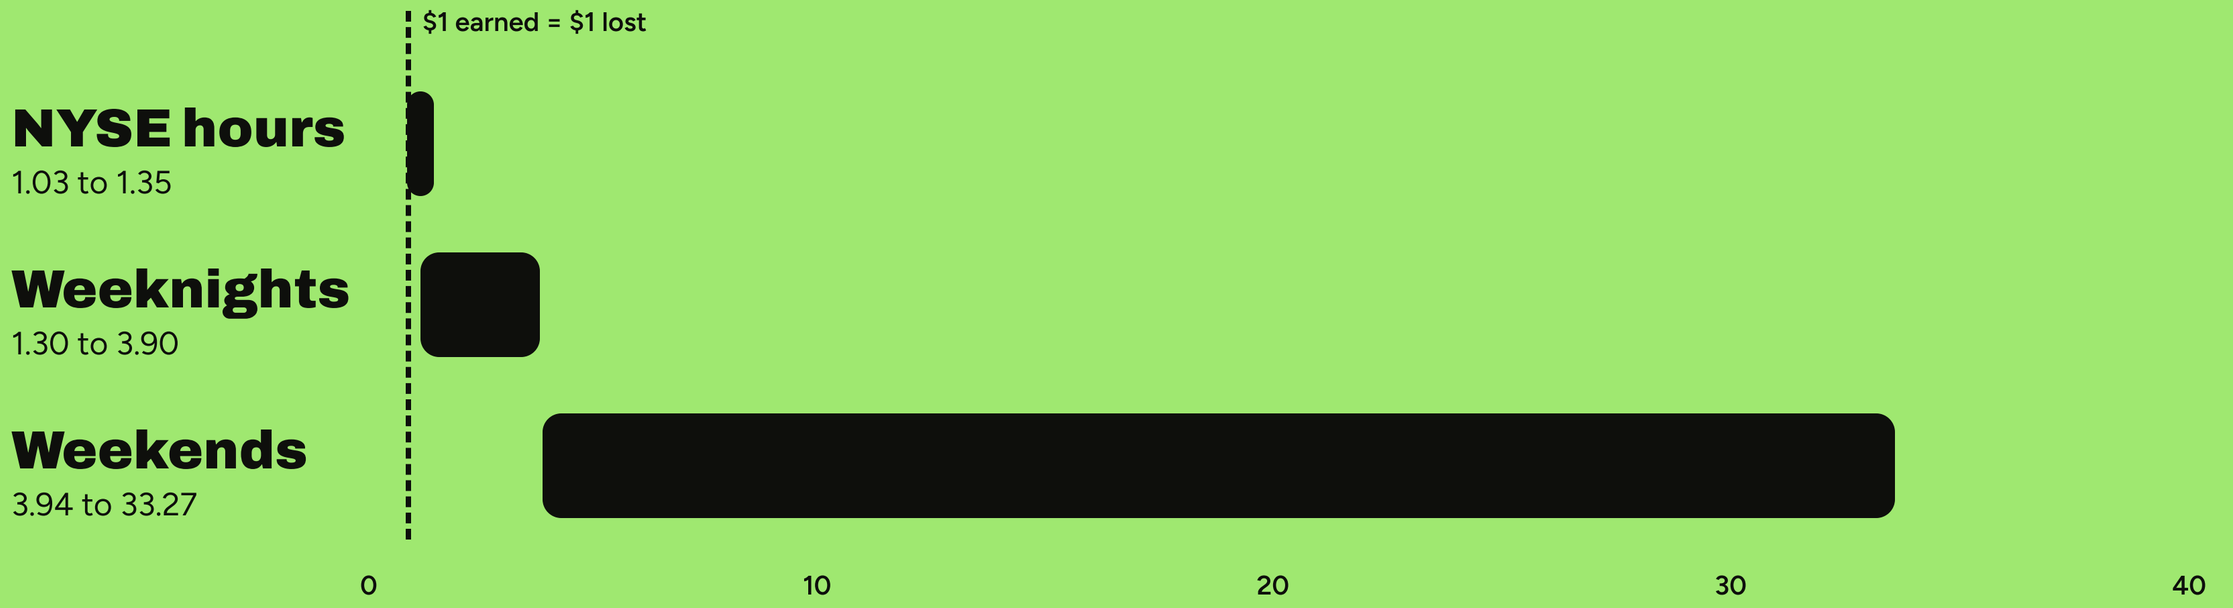

78%

of Stock Token flow arrives outside NYSE regular hours.[3]

Holders cannot see which pool, fee tier and hour pays liquidity providers best. The chain's swap history can.[1]

Sources. [1] stock-vaults-app/README.md. [2] derived: 5 days x 6.5 h = 32.5 of 168 hours (19%). [3] docs/research/founder-house/PLATFORM-TRUTH.md, verdict line 3 and Gap 3 (78%, interval 69 to 85).

Weekends pay $3.94 to $33.27 per $1 lost. NYSE hours pay $1.03 to $1.35.[1]

Pool and fee tier move the number as much as the clock does. Uptick's evidence engine measures it per token and the vault deposits where it is best.[1]

Sources. [1] spikes/stock-vaults/FINDINGS.md and stock-vaults-app/README.md. Fee earned per $1 lost to informed traders (1 hour markout), static ±2% vault, NVDA, SPCX and TSLA pools, 5.1M swaps, 2026-08-24 to 10-17. Range ends are per-pool values: NYSE 1.03 (SPCX) to 1.35 (TSLA 0.30%); weeknights 1.30 (NVDA) to 3.90 (SPCX); weekends 3.94 (NVDA) to 33.27 (TSLA); pooled 1.16, 2.74 and 13.64.

One click, into the pool the evidence picks.

EVIDENCE ENGINE

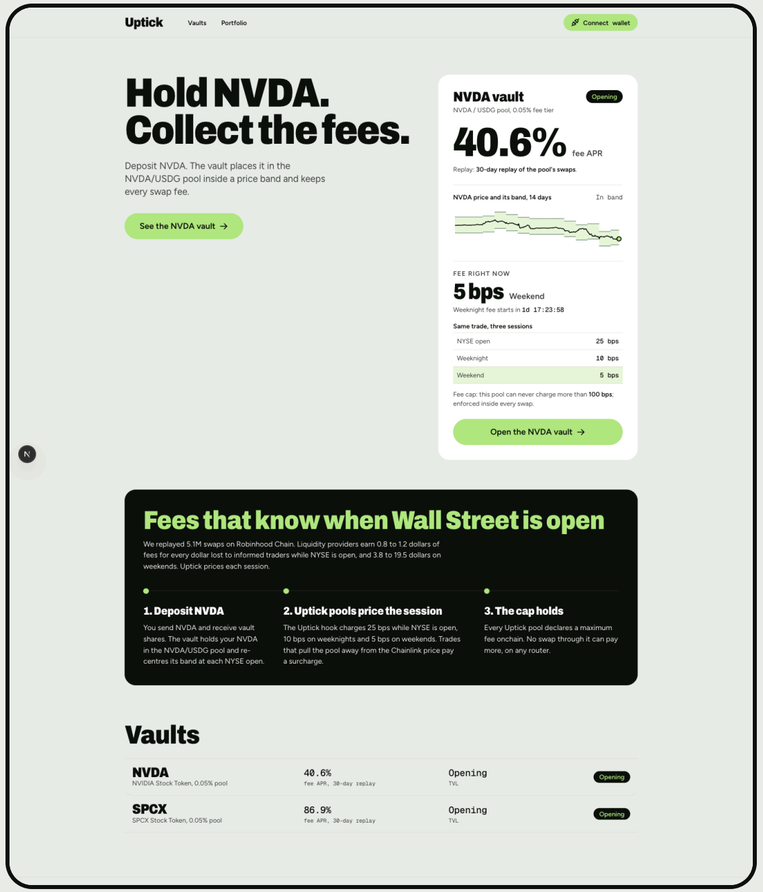

Replays every swap on every USDG pool and tier, and picks the best.[1]

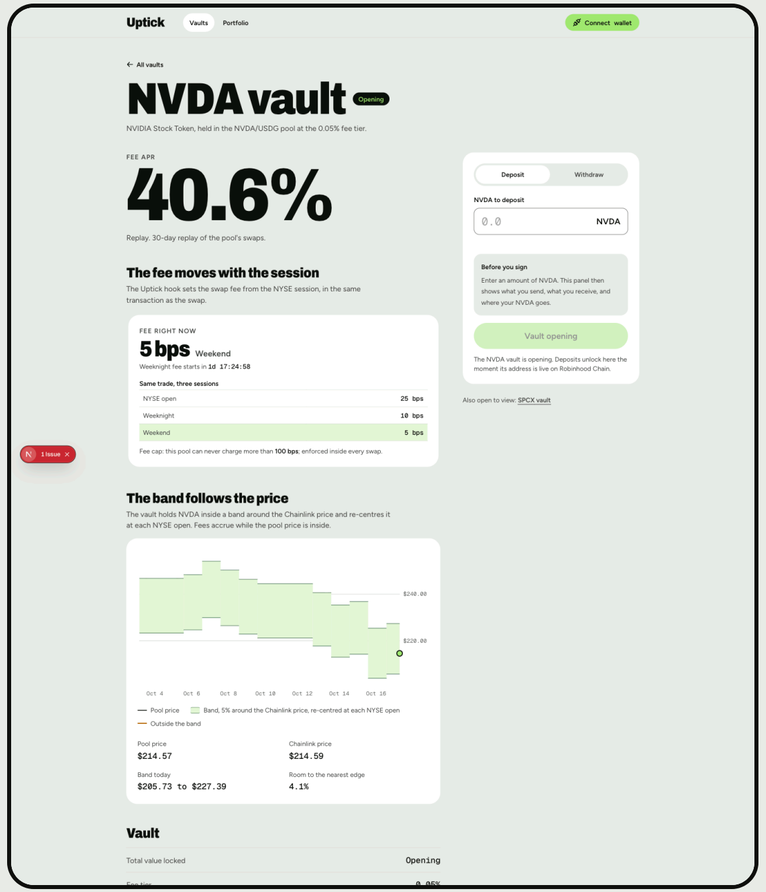

VAULT

ERC-4626 per Stock Token. Deposits into the pick, recentred daily.[1]

APP

Tier comparison, deposit, redeem, portfolio.[1]

Sources. [1] stock-vaults-app/README.md, docs/ARCHITECTURE.md. Screens: web/screens/home-1440.png and vault-nvda-1440.png, the running web app (top of page shown).

An engine that measures the pools. A vault that collects the fees.

Evidence engine
fee per $ of
1h markout
pool and tier pick

1. Replays every swap on every USDG pool and fee tier, split by session.
2. Selects the pool and tier with the best out-of-sample result; the keeper refreshes it daily.
3. Pools sit under the cap standard: **TakeExceedsCap** reverts any take above a hook's declared maximum, on every router.[1]

VAULT LAYER · ERC-4626

→

Selected pool
NVDA / USDG
position

1. Every value-in and value-out passes an oracle gate: Chainlink fresh, TWAP and spot within bounds.
2. Keeper recentres daily at the NYSE open, 13:35 UTC in EDT, after an **eth_call** simulation passes.
3. **redeemInKind** pays both tokens with no oracle, no swap, no pause.[1]

Sources. [1] stock-vaults-app/docs/ARCHITECTURE.md (components, data flow per swap and per deposit). Interactive diagram: docs/architecture.html.

The cap holds on a mainnet fork: 200 of 200 over-cap swaps revert.[1]

0 wei

take accounting vs a no-hook pool, per leg, 64 swaps per shape[1]

2 of 2

nested self-swap directions blocked with NestedStateChange[1]

~25k

gas added per swap by the cap[1]

5.1M

swaps replayed over 54 days on NVDA, SPCX and TSLA pools[2]

```
$ forge test # fork of chain 4663
cap 250, 3% hook : 200/200 revert TakeExceedsCap
cap 300, 3% hook : 200/200 pass
3.01% under cap 300 : reverts 60/60
2.99% under cap 300 : passes 60/60
delete the cap revert : tests go red; restore : green
```

40.6%

NVDA vault fee APR, 30 day replay, daily recentre, 5% band[3]

Sources. [1] spikes/capped-hooks/FINDINGS.md (verdict table, mutation run, gas table). [2] spikes/stock-vaults/FINDINGS.md. [3] stock-vaults-app/README.md, Evidence table (keeper /vaults).

Hooks carry 74.5% of v4 trades on the chain. Quoted fees no longer tell the price.[1]

$15B

cumulative Stock Token volume in the first 100 days since the July 1 mainnet[2]

80%

of 84K hooks labelled malicious by 0x[1]

$1.2M

taken in 49 hours by hooks keeping 5 to 11% while pools quote 0 to 1%[3]

Uptick's cap standard makes a hook declare its maximum and the pool enforce it inside the swap. The vault targets pools without take-capable hooks, or with a registered cap.

REVENUE, AS ARITHMETIC

performance share × vault TVL × fee APR

Fee APR is observed per vault from FeesCollected events; one vault per Stock Token, so revenue scales with the number of tokens and the TVL in each.[1]

Sources. [1] stock-vaults-app/docs/ARCHITECTURE.md, "Data flow per deposit" step 4 and Stats API row. The model is a design of the contracts above; the share rate is a vault parameter.

NVDA first, then SPCX. The holders and the asks are already there.

1

First vaults

The NVDA vault, then SPCX, built for the 189,012 NVDA holders.[1]

2

Robinhood Chain ecosystem

6 chain LPs reporting results, 10 explicit asks for stock-token yield, 9 accounts already lending or LPing stock tokens.[2]

3

Judges and partners

Arbitrum Founder House, Singapore, Oct 23 to 25 2026.[3]

Hook builders get a registry they can read: CapRegistry records each hook's declared maximum, so routers and integrators check what a hook may charge.[4]
