Uptick

Put your Stock Tokens to work.

Deposit the token, see what you keep, exit in kind any time.

uptick-fi.pages.dev, @uptickfi. Kamal, founder, github.com/kamalbuilds.

189,012 wallets hold NVDA on Robinhood Chain. They are asking for yield on it.

"borrow/lend markets, where users can get yield by lending stock or pay yield by shorting stock"

@Nibel_eth, X, 2026-10-11

"tokenized equities like xStocks need to plug directly into defi lending markets so users can earn yield on SPYx or NVDAx while holding them"

@JackNomadsGOD, X, 2026-10-13

"I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks"

@WazzCrypto, X, 2026-10-15

Seven of the eight yield products measured take USDG or pairs. A holder sells the stock to join.

Source: gtm/uptick/DEMAND.md, verbatim. Holders: Blockscout, 2026-10-16. Products: vaults/COMPETITORS.md, read 2026-10-17.

A pool page shows fee APR. It does not show what an LP loses to fast traders.

AMD

131.6%

PLTR

160.4%

SPY

3.5%

Fee APR as one live vault page shows it, 46 times apart on one page, with no loss column.

On the chain's AAPL pool, 13.9 points of 18.8% a year in fees went to informed traders.

Source: TickerSpring Vaults page, copied as displayed, vaults/COMPETITORS.md, 2026-10-17. AAPL: live app, 30 days to 2026-10-17.

Deposit the Stock Token itself. See what you keep. Exit in kind any time.

No sale to join

The vault takes AAPL, NVDA or PLTR, not USDG and not a pair.

Fees beside what you keep

Every vault page shows both side by side, before you sign.

Both tokens come back

Exit in kind has no oracle, no swap and no pause in the way.

Where a year of fees goes

30 days to 2026-10-17

Fees the pool paid, a year +18.8%

- **Kept over the full 30 days** +3.2%
  What stays with depositors after both losses, over the whole window.
- **Recentring cost** 1.7%
  The reposition at 02:00 UTC after each NYSE session.
- **Lost to informed traders** 13.9%
  Trades from people who knew the price was about to move.

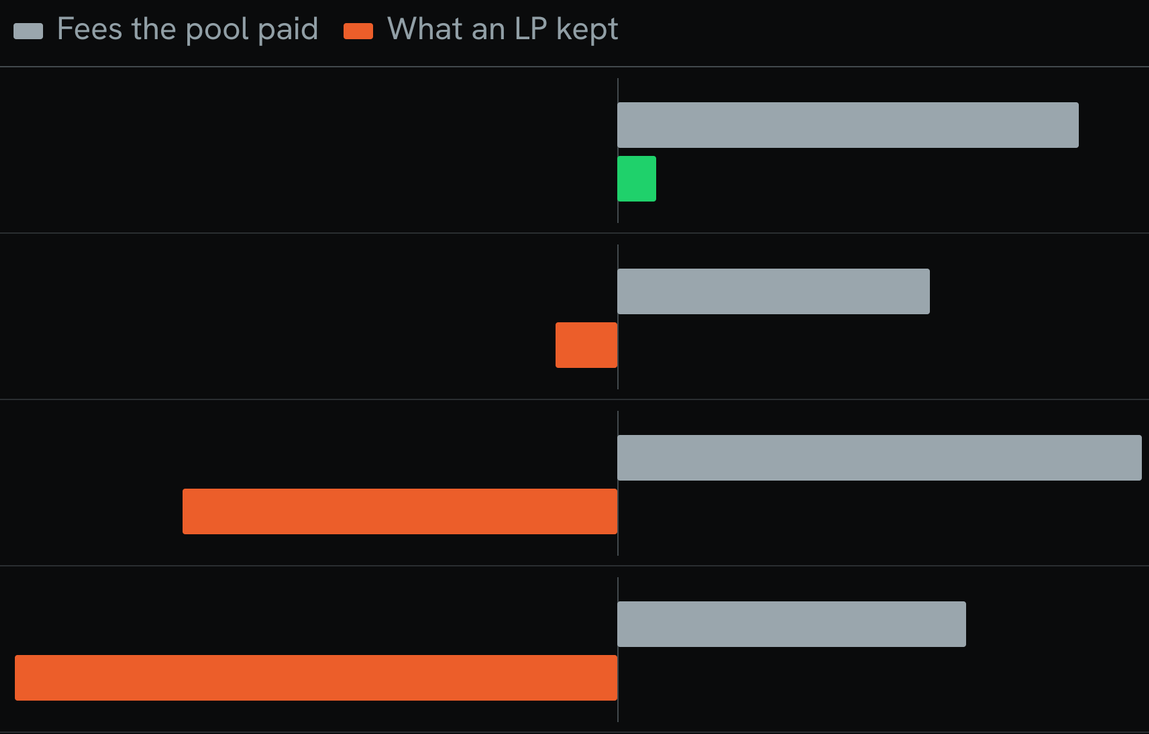

Source: live app, uptick-fi.pages.dev/vault/aapl, 30 days to 2026-10-17. contracts/SECURITY.md for exit in kind.

Live and reviewed. Outreach to 50 named people starts this week.

App	uptick-fi.pages.dev, 17 vaults, each with its door and its reason
Agent API	An MCP endpoint and JSON. A closed vault returns its reason.
Security	Four review rounds, the fourth ended SHIP. 80 of 80 security tests pass.
Outreach	26 holders and LPs, 18 projects and 6 investors, each message ready to send
Interviews	uptick-fi.pages.dev/talk, five questions for holders, open

Source: live app and Worker read 2026-10-23. contracts/SECURITY.md. gtm/uptick/PIPELINE.md, TARGETS.md, EVIDENCE.md.

Fees are not yield. We replayed 3,059,881 swaps to measure what an LP keeps.

Pool	Fees	Kept
PLTR Uniswap v4, 1%	152.9%	+12.8%
PLTR Uniswap v3, 0.3%	103.5%	-20.3%
GME Uniswap v3, 1%	173.7%	-144.2%
SPCX Uniswap v3, 0.05%	115.4%	-199.5%

Source: keeper/data/replay.json, held-out half, 15 days to 2026-10-17, annualised. Kept is fees less losses to informed traders and rebalancing cost. web/lib/vault-universe.json for the swap count.

Every vault sits behind one of three doors.

Open

3 vaults take any amount

AAPL, GOOGL and PLTR (on its Uniswap v4 pool) kept money in both halves of the replay.

Reduced

9 vaults take up to $25,000 a deposit

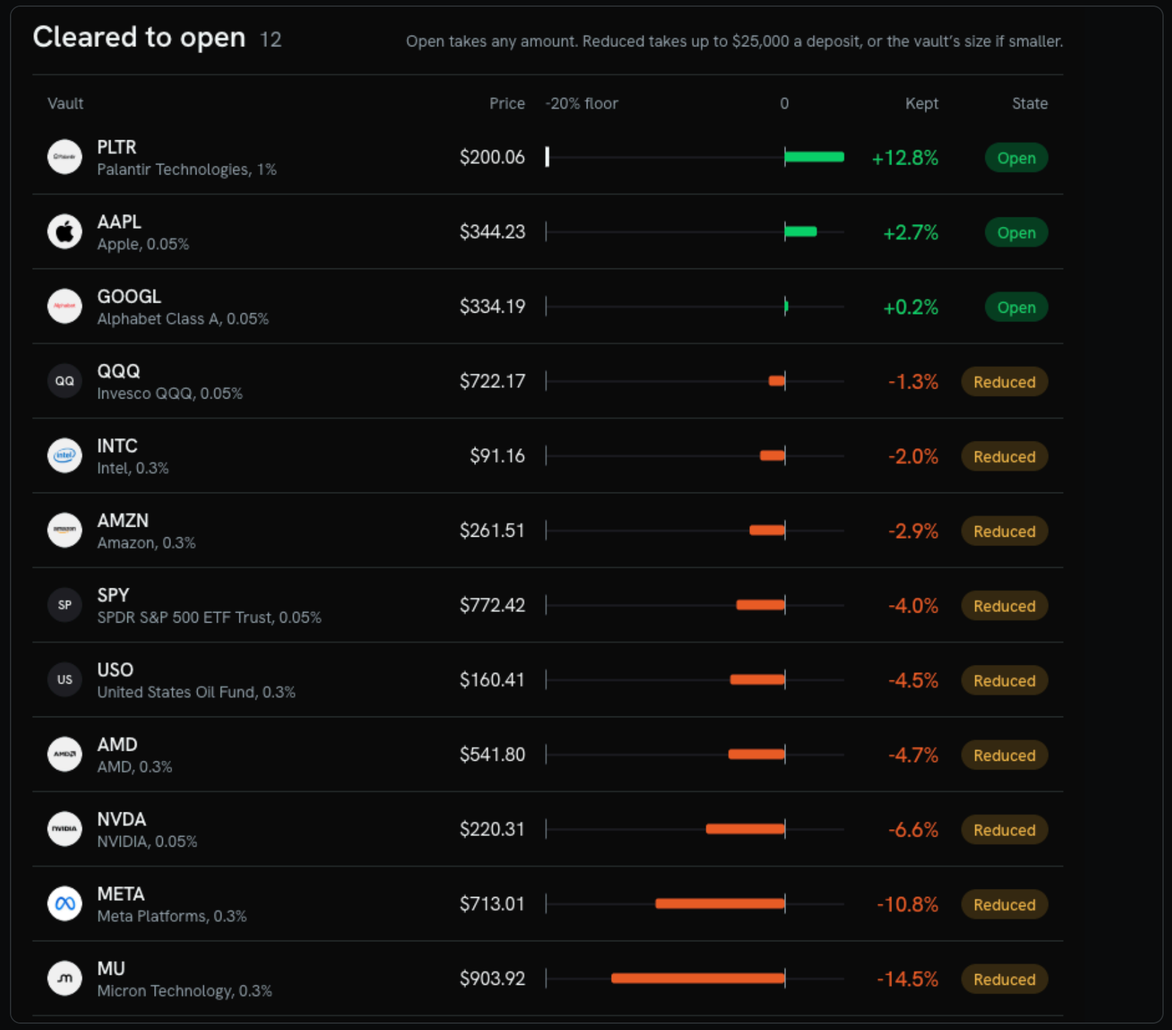

The weaker half sits between -20% and break-even.

Closed

5 vaults take none

The weaker half kept less than the -20% floor.

Exit in kind is always open. Both tokens come back, with no oracle, no swap and no pause in the way.

Source: web app vault list from web/lib/vault-universe.json, captured 2026-10-22. contracts/SECURITY.md for exit in kind.

None of four vault codebases has a settings timelock or stock-split handling. Uptick has both.

	Arrakis V2, Gamma, Veda, AutoRange	Uptick
Owner settings	Change in one transaction	24 hour queue, calldata emitted
Stock split	No multiplier logic	ERC-8056 gate
Deposit priced from	Pool spot or a stored rate	Lowest of Chainlink, TWAP and spot

Source: competitors/*/STUDY.md with file and line citations. Uptick: contracts/SECURITY.md. Full table in the appendix.

Depositors keep every fee at launch. Uptick takes a share only where they still keep money.

Uptick's share

0% to 10%

0% at launch. Switched on per vault, behind the 24 hour queue, where the replay keeps money net of it.

Entry fee

0.35%

1% on the 1% pools. It stays in the vault for the holders who stay.

Exit in kind

$0

in either token, at any time.

Revenue grows with the Stock Tokens in the vaults and the fees their pools pay.

Source: contracts/script/DeployAll.s.sol (PERF_FEE_BPS, default 0), contracts/SECURITY.md (Entry fee, Performance fee), web/lib/vault-universe.json.

The market is already on the chain: 189,012 NVDA holders and $623.9k of LP fees a week.

NVDA holders

189,012

SPCX has 114,222. Blockscout, 2026-10-16.

Traded in 7 days

$488.40M

on the 17 vault tokens' Uniswap v3 and v4 pools.

Paid to LPs in 7 days

$623.9k

the fee pot a vault shares in.

About half of the top ten tokens' supply already sits in AMM pools.

Source: docs/research/founder-house/PLATFORM-TRUTH.md (Blockscout, 2026-10-16) and vaults/VENUES.md (blocks 87,352,064 to 93,292,983, 2026-10-13 to 2026-10-20).

One founder built the contracts, the replay engine, the app and the agent API.

Kamal

Founder. github.com/kamalbuilds

Contracts	StockVault and StockVaultV4, ERC-4626. 80 of 80 security tests, 50 mutation checks.
Replay engine	3,059,881 swaps across 17 vault pools.
App	17 vault pages, each with its gate and its reason.
Agent API	MCP endpoint with four tools.

Source: this repository. contracts/SECURITY.md, web/lib/vault-universe.json, api/src/mcp.ts.

We are raising $2M to put every Stock Token on Robinhood Chain to work.

$2M pre-seed	A vault for every Stock Token the day it lists, on v3 and v4 pools, with an external audit and two engineers on the keeper and risk engine.
In 12 months	$50M of Stock Tokens earning in Uptick vaults, and vault shares accepted as collateral by Robinhood Chain lenders.
From this room	Holders who will size a first deposit, and the lenders, range vaults and wallets that carry the kept APR.

Uptick shows which of your Stock Tokens can earn, and how much you would keep.

uptick-fi.pages.dev, @uptickfi, github.com/kamalbuilds.

Appendix

The evidence behind each slide, and the two Open House canvases.

Price ranges and sessions	One price range for every token loses. In the 30-day replay, weekends pay $2.76 per $1 lost, NYSE hours $0.98.
Gate table	All 17 tokens, price range, weaker half and door.
Code, venues, security, agents	Four codebases compared, the venue census, four review rounds, the MCP responses.
Open House canvases	Go-to-market and product, filled in for Uptick.

Source: this repository. Every figure carries its file on the slide it appears on.

One price range for every token would lose: the range that kept +29.4% on NVDA kept -58.8% on GOOGL.

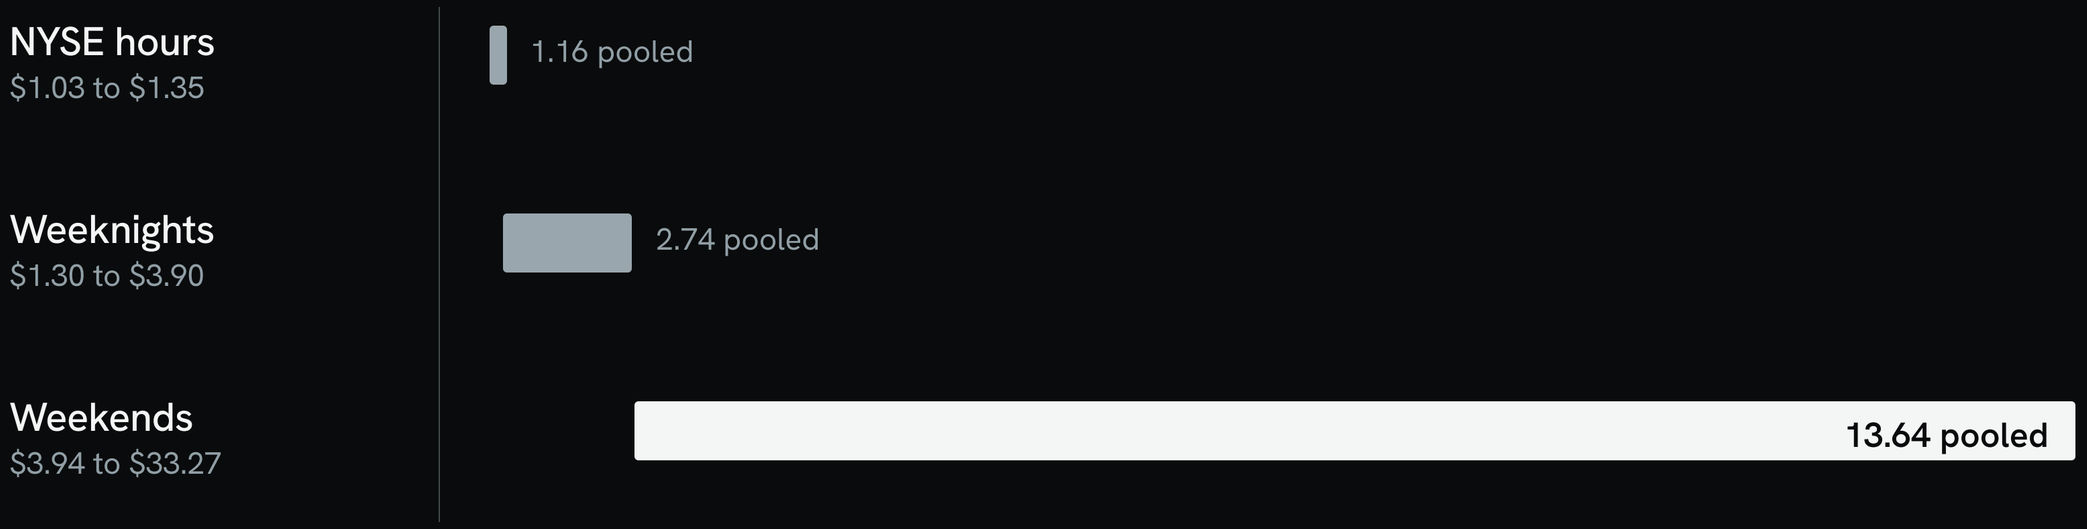

Kept APR in the calibration half, by price range. Each token picks its own, and the held-out half decides the door.

	Range ±1.5%	Range ±5%	Range ±20%
NVDA	+29.4%	+12.2%	+3.3%
AAPL	-11.1%	+2.5%	+1.6%
GOOGL	-58.8%	-5.6%	+0.2%

The picks: NVDA ±1.5%, AAPL ±7.5%, GOOGL ±20%. The ranges run from ±1.5% to ±20% across the 17 tokens.

Source: keeper/data/price range-grid/grid-summary.json (calibration half, 2026-09-17 to 2026-10-02), keeper/data/params.json.

In a fixed range on NVDA, SPCX and TSLA over 54 days, a weekend pays $13.64 per $1 lost to fast traders. NYSE hours pay $1.16.

5.1M swaps, 54 days, three pools

NVDA, SPCX and TSLA on Robinhood Chain. The weekend ratio beats the NYSE ratio in 22 of 23 pool-weeks.

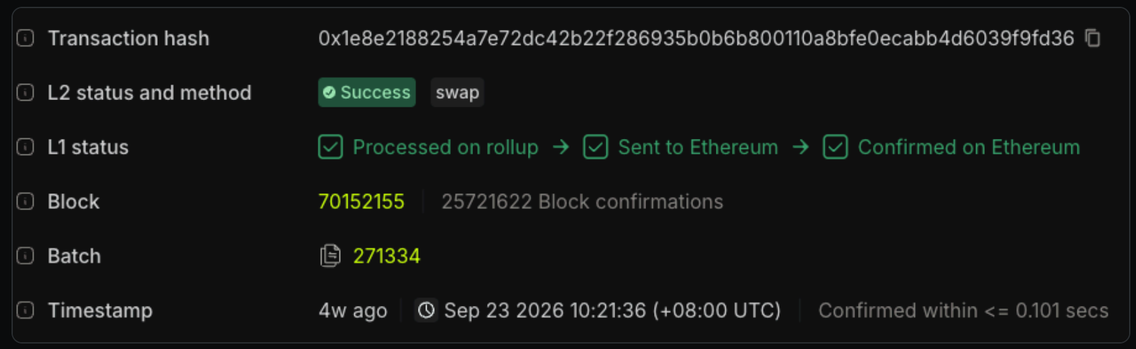

The engine drops what its own replay refutes

A schedule built on the clock met its bar on 0 of 3 tokens, and random session labels beat it in 64 of 64 cells. Twelve off-chain signals failed their shuffled control. Uptick acts on pool and price range, measured per token.

Source: README.md, spikes/stock-vaults/FINDINGS.md, spikes/offchain-signals/FINDINGS.md. Fee earned per $1 lost to informed flow, 1 hour markout, window 2026-08-24 to 2026-10-17.

With Nasdaq shut, one PLTR sale paid its pool $178.30 and cost its liquidity providers $241.83.

Sold, 10:21 PM New York	95.8 PLTR
Pool price, Chainlink price	$186.51, $184.67
Pool price an hour later	$183.75
Fee the pool earned	$178.30
Lost to liquidity providers	$241.83
Fee per $1 lost	$0.74

The transaction on Blockscout. The page clock reads +08:00; 10:21:36 there is 02:21:36 UTC. One routed trade made 7 pool swaps; this is its PLTR / USDG leg.

The replay counts every swap this way. Across the 17 pools the vaults sit in, a weekend earns $2.76 in fees for every $1 lost, NYSE hours $0.98.

Source: keeper/scripts/moment.py, keeper/data/replay.json window 2026-09-17 to 2026-10-17. Tx 0x1e8e2188254a7e72dc42b22f286935b0b6b800110a8bfe0ecabb4d6039f9fd36 read with cast tx on rpc.mainnet.chain.robinhood.com. Loss is the 1 hour markout.

Each token picks its price range on the first half. The second half decides the door.

AAPL kept +2.7% a year in its weaker half

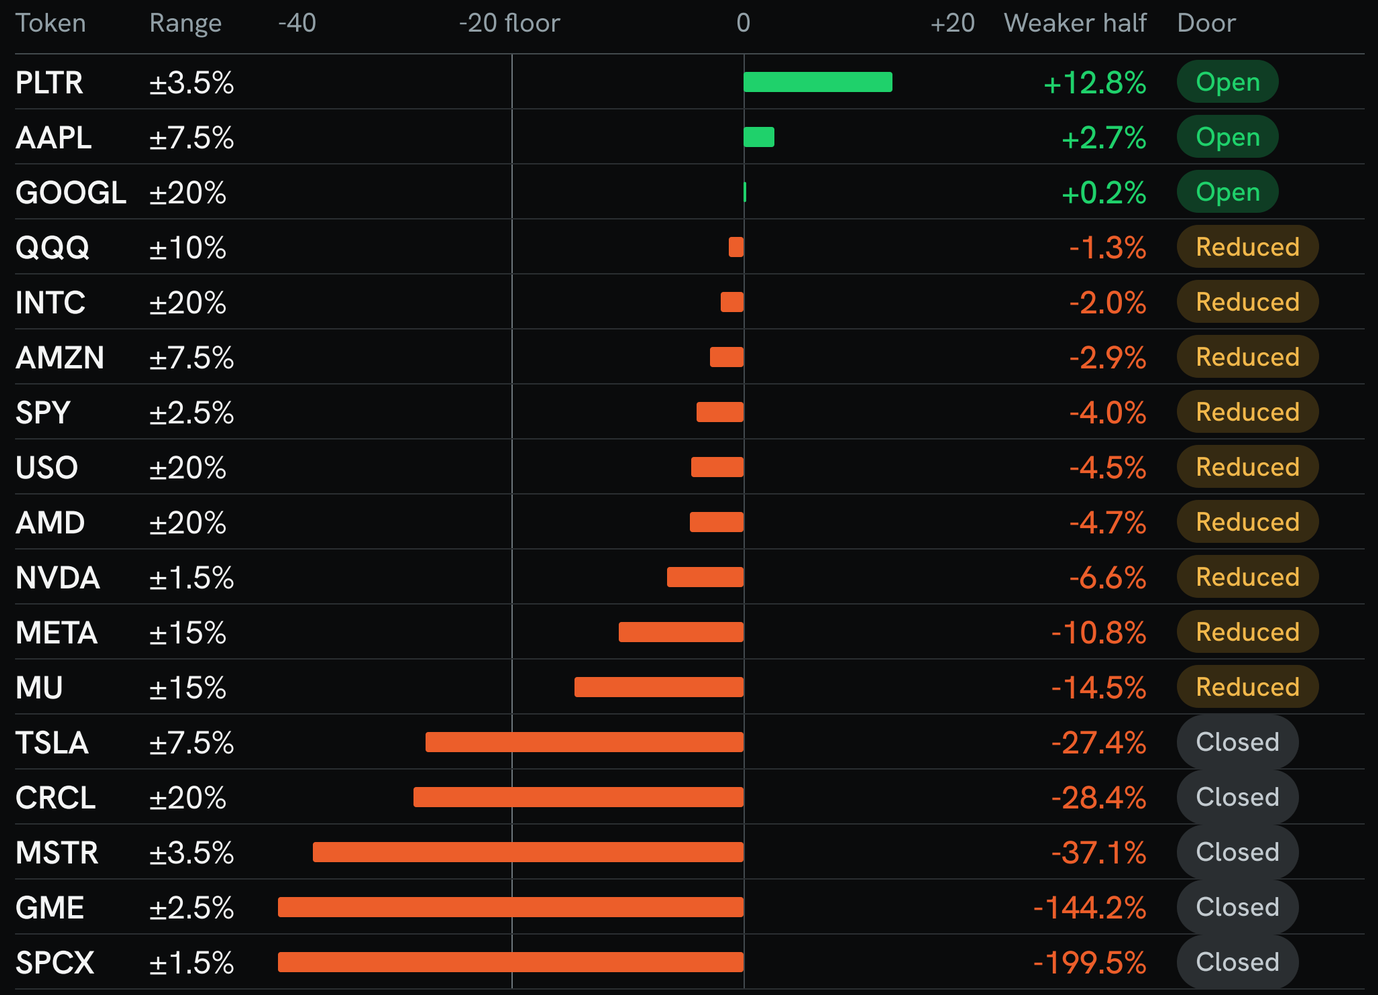

Range ±7.5%. First half +2.7%, held-out half +3.9%. Open. PLTR keeps +12.8% on its v4 pool.

NVDA's tight price range kept +29.4% on the first half

The held-out half kept -6.6%. The gate shows the held-out number, so NVDA is reduced.

The conservative figure decides

The upper accounting bound sits beside it on every vault page.

Source: web/lib/vault-universe.json, keeper/data/params.json. Weaker half of two 15 day halves, 30 days to 2026-10-17. Bars end at -40.

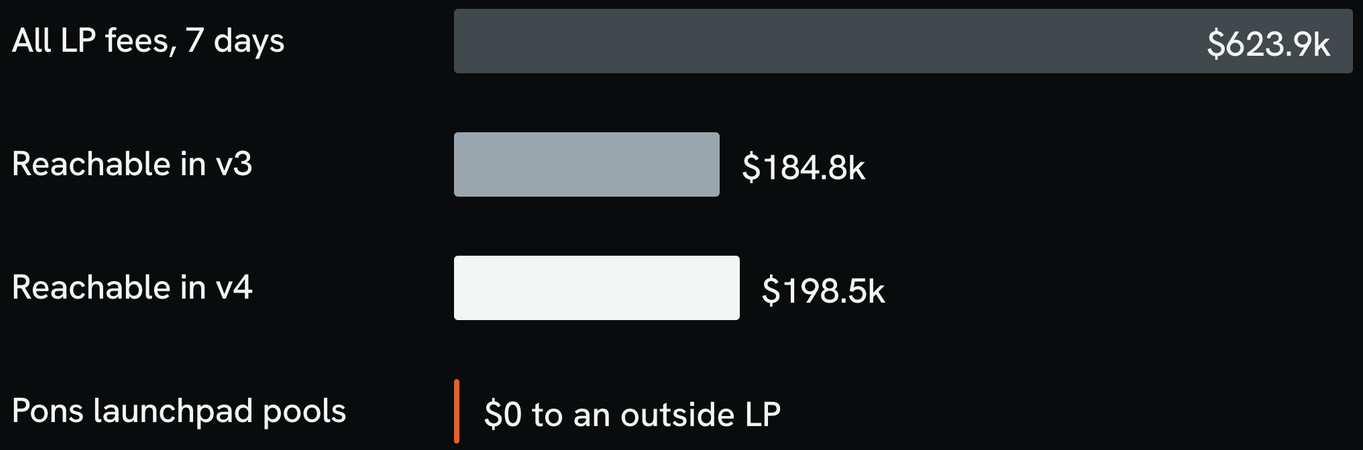

None of four vault codebases has a settings timelock or stock-split handling. Uptick has both.

Codebase	Owner settings	Stock split	Deposit priced from
AutoRange	24 setters, each takes effect at once	Raw balances and ticks, no multiplier	Pool spot
Arrakis V2	Manager, fee, pool and router change at once	Plain ERC-20 shares, no multiplier	Pool spot
Gamma	setFee, setTwapCheck, ownership: one transaction	Raw balances, no multiplier	Pool spot, optional 1 hour TWAP filter
Veda	Bounds, fees and roots apply in the same transaction	No ERC-8056 or rebase logic	Stored rate, no maximum age
Uptick	**24 hour queue**, calldata emitted, void after 7 days	**ERC-8056 gate**: price-checked paths close around each multiplier change	Lowest of Chainlink, TWAP and spot

Session-fee hooks (Fables, SessionFeeHook, Bellswap, ClosingBell) price swaps. Range vaults pick price ranges by hand. Uptick publishes the calibration for every token and opens a door only where it holds.

Source: competitors/*/STUDY.md with file and line citations (Arrakis V2, Gamma Hypervisor, Veda BoringVault, AutoRange). Uptick: contracts/SECURITY.md.

The fees sit in more than one pool. The v4 adapter widens the pot a vault can reach.

$488.40M of Stock Token volume moved through Uniswap v3 and v4 on the 17 tokens in 7 days. Launchpad pools pair a stock with a memecoin across 256 traded pools and $9.95M, and take their fee in the hook.

PLTR, price range 350 bps

The v3 0.3% pool keeps -20.3% in its weaker half and stays closed.

+12.8%

What the PLTR v4 1% pool keeps in its weaker half in the same replay, net of the PoolManager's protocol fee. PLTR launches open on it.

Built: the v4 position adapter

StockVaultV4 holds a position in a hookless v4 pool, with the same guards and the same evidence gate.

Source: docs/research/founder-house/vaults/VENUES.md (2026-10-13 to 2026-10-20, read over the public RPC). keeper/data/replay.json, PLTR pools.

Four review rounds, each re-reading the last round's fixes. The fourth ended SHIP.

Round 1	1 High and 3 Medium, all closed	A same-block share lock and a spot-to-TWAP price range against deploy sandwiches. Deposits priced at the lowest of Chainlink, TWAP and spot. A 24 hour owner queue. A corporate-action gate on the token's oracle pause and multiplier.
Round 2	Round 1 fixes confirmed	Swap floors include the pool fee, so 1% pools rebalance. Router deposits clear at $500, $2,000 and $10,000.
Round 3	TWAP bound set to 30 bp	Entry fee raised to 35 bp, so a deposit ahead of a price update does not pay. Exits work on every fee tier.
Round 4	SHIP: no Critical, High or Medium	Residuals are published with their measured bounds and the lever that moves each.

80 of 80
security tests pass on a fork of the real pools

50
mutation checks: break a guard, see red, restore, see green

24 h
queue on every owner setting, with the full calldata emitted

In kind
exit stays open when everything else is closed

Source: contracts/SECURITY.md and the four reports in contracts/ (SECURITY-REVIEW, SECURITY-REREVIEW, SECURITY-REVIEW-3, SECURITY-REVIEW-4, 2026-10-20). Contracts final, creation-code hash pinned.

Agents read the same evidence the app shows.

list_vaults	Every vault with its door, fee APR and kept APR.
get_vault_evidence	Replay pools, gate rule, reason and swap count.
prepare_deposit	Unsigned transactions. The user signs and sends.
prepare_withdraw	Unsigned exit transactions, in kind included.

One endpoint, MCP over Streamable HTTP. A closed vault returns its gate reason, so an agent never routes a deposit past the door.

GET /vaults/aapl, gate.reason

"Open: the weaker half of the 30-day replay kept 2.7% a year, at or above break-even, across 95,275 swaps."

tools/call prepare_deposit, id spcx, amount 10

{"error": "Closed: the weaker half kept -199.5% a year, below the -20% floor."}

GET /vaults/aapl, pools: fee APR, first half, held-out half

Pool	Fees	First	Held-out
v3 0.05%	18.8%	+2.7%	+3.9%
v4 0.3%	23.0%	+7.6%	+0.3%
v3 0.3%	11.3%	-16.4%	-12.8%

Evidence API and MCP: uptick-evidence.earn-shield-alerts.workers.dev; figures as keeper/src/evidence.ts builds them from keeper/data/replay.json (2026-10-22). llms.txt and the evidence API are open to any agent.

Source: keeper/src/evidence.ts on keeper/data/replay.json, api/src/mcp.ts, web/public/llms.txt.

Go-to-market canvas

Arbitrum Open House Singapore

Team name

Uptick
Kamal, founder

One line

Deposit a Stock Token, see what you keep, earn the fee share.

Who buys, who uses

Buys and uses: Stock Token holders on Robinhood Chain, 189,012 of them on NVDA. Also uses: agents on the MCP endpoint. Carry the kept APR: lenders, wallets and range vaults.

First reachable audience

26 holders and LPs who posted about stock-token yield in the last 30 days, led by @WazzCrypto (62,039 followers) and @Nibel_eth (36,595).

3 distribution channels

1. Named DMs and replies on X
2. 15 minute calls with 18 projects
3. /talk interviews and the open evidence API

Core message

Fees are not yield. Uptick shows what you keep and opens a vault only where past swaps say it holds.

Proof you need first

The first mainnet deposit into an open vault (AAPL, GOOGL or PLTR) and one signed holder LOI.

The intro that helps

Arbitrum Foundation to **Gaëtan Thabot**, Robinhood Chain partnerships, to put the vault list in front of Stock Token holders.

5 named targets

1. @WazzCrypto, LPs stock tokens by hand
2. Zona (DataLust): vault shares as collateral
3. AutoRange (elkiyo.eth): list Uptick vaults
4. Rabby (Galen Yuan): show vault positions
5. Doppler (Austin Adams): route idle reserves into vaults

The ask this weekend

The Thabot intro, calls with Zona and AutoRange, three holders sizing a first deposit. **uptick-fi.pages.dev/talk**

Source: gtm/uptick/TARGETS.md, PIPELINE.md, EVIDENCE.md. web/lib/vault-universe.json. docs/research/founder-house/PLATFORM-TRUTH.md.

Product canvas

Arbitrum Open House Singapore

Team name

Uptick
Kamal, founder

One line

Deposit a Stock Token, see what you keep, earn the fee share.

Who is this for

@WazzCrypto, 62,039 followers, LPs tokenized stocks on Robinhood Chain by hand: "I'd have been massively profitable on RH chain if I had stuck to LP'ing tokenized stocks."

What they do today

Hold NVDA idle, or LP by hand: pick the pool, the fee tier and the price range, then read a fee APR with no loss column.

The wedge

Kept APR, measured per token on 3,059,881 replayed swaps. A vault opens only where it holds: 3 open, 9 reduced, 5 closed.

Why now

195 Stock Tokens listed, NVDA at 189,012 holders, 58% of swaps and 51% of LP fees outside NYSE hours (30-day replay). Kraken and Kamino launched xStocks yield vaults on Solana.

Alternatives and gaps

HedgeHood: weekly covered calls on NVDA. TickerSpring, AutoRange: USDG in. Morpho: lenders earn, holders do not. None shows kept APR.

Why onchain, why Arbitrum

Robinhood Chain is an Arbitrum Orbit chain. The Stock Token, its Chainlink feed and the USDG pool share one chain, so valuation and exit need no bridge. Agents read it over MCP.

First 5 to 10 users, named, reachable this month

@WazzCrypto, @Nibel_eth, @0xFent_, @JollyDinger, @cryptonoah11, @omarsaleh66, @0x_iroh, @0xlippit. Each one posted about stock-token LPs or yield in the last 30 days and has a message queued.

Ship this weekend

The first mainnet vaults once the deployer is funded. The 60 second agent demo over MCP. /talk interviews in the room.

Source: gtm/uptick/DEMAND.md, TARGETS.md. docs/research/founder-house/vaults/COMPETITORS.md, PLATFORM-TRUTH.md. README.md.
